## DA Form 1 – Development application details

Approved form (version 1.3 effective 28 September 2020) made under section 282 of the Planning Act 2016.

This form **must** be used to make a development application **involving code assessment or impact assessment**, except when applying for development involving only building work.

For a development application involving building work only, use DA Form 2 – Building work details.

For a development application involving building work associated with any other type of assessable development (i.e. material change of use, operational work or reconfiguring a lot), use this form (*DA Form 1*) and parts 4 to 6 of *DA Form 2 – Building work details.* 

Unless stated otherwise, all parts of this form **must** be completed in full and all required supporting information **must** accompany the development application.

One or more additional pages may be attached as a schedule to this development application if there is insufficient space on the form to include all the necessary information.

This form and any other form relevant to the development application must be used to make a development application relating to strategic port land and Brisbane core port land under the *Transport Infrastructure Act 1994*, and airport land under the *Airport Assets (Restructuring and Disposal) Act 2008.* For the purpose of assessing a development application relating to strategic port land and Brisbane core port land, any reference to a planning scheme is taken to mean a land use plan for the strategic port land, Brisbane port land use plan for Brisbane core port land, or a land use plan for airport land.

Note: All terms used in this form have the meaning given under the Planning Act 2016, the Planning Regulation 2017, or the Development Assessment Rules (DA Rules).

1) Applicant details	
Applicant name(s) (individual or company full name)	Debell Property Pty Ltd as trustee for Debell Property Trust
Contact name (only applicable for companies)	Brendan Ferris
Postal address (P.O. Box or street address)	C/- Town Planning Alliance PO Box 7657
Suburb	East Brisbane
State	Qld
Postcode	4169
Country	Australia
Contact number	07 3361 9999
Email address (non-mandatory)	eda@tpalliance.com.au
Mobile number (non-mandatory)	
Fax number (non-mandatory)	
Applicant's reference number(s) (if applicable)	22-0117

## PART 1 – APPLICANT DETAILS

#### 2) Owner's consent

2.1) Is written consent of the owner required for this development application?

Yes – the written consent of the owner(s) is attached to this development application

 $\boxtimes$  No – proceed to 3)

## PART 2 – LOCATION DETAILS

<ol> <li>Location of the premises (complete 3.1) or 3.2), and 3.3) as applicable)</li> <li>Note: Provide details below and attach a site plan for any or all premises part of the development application. For further information, see <u>DA</u> Forms Guide: Relevant plans.</li> </ol>

#### 5) Are there any existing easements over the premises?

Note: Easement uses vary throughout Queensland and are to be identified correctly and accurately. For further information on easements and how they may affect the proposed development, see <u>DA Forms Guide</u>.

Yes – All easement locations, types and dimensions are included in plans submitted with this development application

🗌 No

## PART 3 – DEVELOPMENT DETAILS

#### Section 1 – Aspects of development

6.1) Provide details about the first development aspect
a) What is the type of development? (tick only one box)
Material change of use Reconfiguring a lot Operational work Building work
b) What is the approval type? (tick only one box)
Development permit Preliminary approval Preliminary approval that includes a variation approva
c) What is the level of assessment?
Code assessment Impact assessment (requires public notification)
d) Provide a brief description of the proposal (e.g. 6 unit apartment building defined as multi-unit dwelling, reconfiguration of 1 lot into 3 lots):
Dwelling house
e) Relevant plans <b>Note</b> : Relevant plans are required to be submitted for all aspects of this development application. For further information, see <u>DA Forms guide:</u> <u>Relevant plans</u> .
$\boxtimes$ Relevant plans of the proposed development are attached to the development application
6.2) Provide details about the second development aspect
a) What is the type of development? (tick only one box)
Material change of use       Reconfiguring a lot       Operational work       Building work
b) What is the approval type? (tick only one box)
Development permit Preliminary approval Preliminary approval that includes a variation approva
c) What is the level of assessment?
Code assessment Impact assessment (requires public notification)
d) Provide a brief description of the proposal (e.g. 6 unit apartment building defined as multi-unit dwelling, reconfiguration of 1 lot into s lots):
e) Relevant plans Note: Relevant plans are required to be submitted for all aspects of this development application. For further information, see <u>DA Forms Guide:</u> <u>Relevant plans.</u>
Relevant plans of the proposed development are attached to the development application
6.3) Additional aspects of development
Additional aspects of development are relevant to this development application and the details for these aspects that would be required under Part 3 Section 1 of this form have been attached to this development application
Not required

#### Section 2 – Further development details

7) Does the proposed development application involve any of the following?		
Material change of use	$oxed{i}$ Yes – complete division 1 if assessable against a local planning instrument	
Reconfiguring a lot	Yes – complete division 2	
Operational work	Yes – complete division 3	
Building work	Yes – complete DA Form 2 – Building work details	

#### Division 1 – Material change of use

Note: This division is only required to be completed if any part of the development application involves a material change of use assessable against a local planning instrument.

8.1) Describe the proposed material change of use				
Provide a general description of the proposed use	Provide the planning scheme definition (include each definition in a new row)	Number of dwelling units (if applicable)	Gross floor area (m²) <i>(if applicable)</i> n/a	
Dwelling	Dwelling house	n/a		
8.2) Does the proposed use involve the use of existing buildings on the premises?				
☐ Yes				
🛛 No				

#### Division 2 – Reconfiguring a lot

Note: This division is only required to be completed if any part of the development application involves reconfiguring a lot.

#### 9.1) What is the total number of existing lots making up the premises?

9.2) What is the nature of the lot reconfiguration? (tick all applicable boxes)				
Subdivision (complete 10))	Dividing land into parts by agreement (complete 11))			
Boundary realignment (complete 12))	Creating or changing an easement giving access to a lot from a constructed road (complete 13))			

10) Subdivision				
10.1) For this development, how many lots are being created and what is the intended use of those lots:				
Intended use of lots created	Commercial	Industrial	Other, please specify:	
Number of lots created				
10.2) Will the subdivision be stag	ged?			
Yes – provide additional deta	ils below			
□ No				
How many stages will the works				
What stage(s) will this developm apply to?				

11) Dividing land into parts by agreement – how many parts are being created and what is the intended use of the parts?				
Intended use of parts created	Residential	Commercial	Industrial	Other, please specify:
Number of parts created				

12) Boundary realignment				
12.1) What are the current a	nd proposed areas for each lo	t comprising the premises?		
Curre	ent lot	Proposed lot		
Lot on plan description Area (m <sup>2</sup> )		Lot on plan description	Area (m <sup>2</sup> )	
12.2) What is the reason for the boundary realignment?				

13) What are the dimensions and nature of any existing easements being changed and/or any proposed easement? (attach schedule if there are more than two easements)				
Existing or proposed?	Width (m)	Length (m)	Purpose of the easement? (e.g. pedestrian access)	Identify the land/lot(s) benefitted by the easement

#### Division 3 – Operational work

Note: This division is only required to be completed if any part of the development application involves operational work.

	14.1) What is the nature of the operational work?				
	Road work	Stormwater	Water infrastructure		
	Drainage work	Earthworks	Sewage infrastructure		
ļ	Landscaping	Signage	Clearing vegetation		
	Other – please specify:				
	14.2) Is the operational work nec	essary to facilitate the creation of	new lots? (e.g. subdivision)		
	Yes – specify number of new	lots:			
	🗌 No				
	14.3) What is the monetary value	e of the proposed operational work	(include GST, materials and labour)		
	\$				

## PART 4 – ASSESSMENT MANAGER DETAILS

15) Identify the assessment manager(s) who will be assessing this development application
Douglas Shire Council
16) Has the local government agreed to apply a superseded planning scheme for this development application?
Yes – a copy of the decision notice is attached to this development application
The local government is taken to have agreed to the superseded planning scheme request – relevant documents
attached
No No

## PART 5 – REFERRAL DETAILS

17) Does this development application include any aspects that have any referral requirements? Note: A development application will require referral if prescribed by the Planning Regulation 2017. No, there are no referral requirements relevant to any development aspects identified in this development application - proceed to Part 6 Matters requiring referral to the Chief Executive of the Planning Act 2016: Clearing native vegetation Contaminated land (unexploded ordnance) Environmentally relevant activities (ERA) (only if the ERA has not been devolved to a local government) Fisheries – aquaculture Fisheries – declared fish habitat area Fisheries – marine plants Fisheries – waterway barrier works Hazardous chemical facilities Heritage places – Queensland heritage place (on or near a Queensland heritage place) Infrastructure-related referrals – designated premises Infrastructure-related referrals – state transport infrastructure Infrastructure-related referrals – State transport corridor and future State transport corridor Infrastructure-related referrals – State-controlled transport tunnels and future state-controlled transport tunnels Infrastructure-related referrals – near a state-controlled road intersection Koala habitat in SEQ region – interfering with koala habitat in koala habitat areas outside koala priority areas Koala habitat in SEQ region – key resource areas Ports – Brisbane core port land – near a State transport corridor or future State transport corridor Ports – Brisbane core port land – environmentally relevant activity (ERA) Ports – Brisbane core port land – tidal works or work in a coastal management district Ports – Brisbane core port land – hazardous chemical facility Ports – Brisbane core port land – taking or interfering with water Ports – Brisbane core port land – referable dams Ports – Brisbane core port land – fisheries Ports – Land within Port of Brisbane's port limits (below high-water mark) SEQ development area SEQ regional landscape and rural production area or SEQ rural living area – tourist activity or sport and recreation activity SEQ regional landscape and rural production area or SEQ rural living area – community activity SEQ regional landscape and rural production area or SEQ rural living area – indoor recreation SEQ regional landscape and rural production area or SEQ rural living area – urban activity SEQ regional landscape and rural production area or SEQ rural living area – combined use Tidal works or works in a coastal management district Reconfiguring a lot in a coastal management district or for a canal Erosion prone area in a coastal management district Urban design Water-related development – taking or interfering with water Water-related development – removing quarry material (from a watercourse or lake) Water-related development – referable dams Water-related development –levees (category 3 levees only) Wetland protection area Matters requiring referral to the local government: Airport land Environmentally relevant activities (ERA) (only if the ERA has been devolved to local government)

Heritage places – Local heritage places

Matters requiring referral to the Chief Executive of the distribution entity or transmission entity:

Infrastructure-related referrals – Electricity infrastructure

Matters requiring referral to:

- The Chief Executive of the holder of the licence, if not an individual
- The holder of the licence, if the holder of the licence is an individual

Infrastructure-related referrals - Oil and gas infrastructure

Matters requiring referral to the Brisbane City Council:

Ports – Brisbane core port land

Matters requiring referral to the Minister responsible for administering the Transport Infrastructure Act 1994:

Ports – Brisbane core port land (where inconsistent with the Brisbane port LUP for transport reasons)

Ports – Strategic port land

Matters requiring referral to the relevant port operator, if applicant is not port operator:

Ports - Land within Port of Brisbane's port limits (below high-water mark)

Matters requiring referral to the **Chief Executive of the relevant port authority**:

Ports - Land within limits of another port (below high-water mark)

Matters requiring referral to the **Gold Coast Waterways Authority:** 

Tidal works or work in a coastal management district (in Gold Coast waters)

Matters requiring referral to the Queensland Fire and Emergency Service:

Tidal works or work in a coastal management district (involving a marina (more than six vessel berths))

#### 18) Has any referral agency provided a referral response for this development application?

☐ Yes – referral response(s) received and listed below are attached to this development application ⊠ No

Referral requirement	Referral agency	Date of referral response
	In the second second second second second	and the second state of th

Identify and describe any changes made to the proposed development application that was the subject of the referral response and this development application, or include details in a schedule to this development application *(if applicable)*.

## PART 6 – INFORMATION REQUEST

19) Information request under Part 3 of the DA Rules

I agree to receive an information request if determined necessary for this development application

I do not agree to accept an information request for this development application

Note: By not agreeing to accept an information request I, the applicant, acknowledge:

 that this development application will be assessed and decided based on the information provided when making this development application and the assessment manager and any referral agencies relevant to the development application are not obligated under the DA Rules to accept any additional information provided by the applicant for the development application unless agreed to by the relevant parties

• Part 3 of the DA Rules will still apply if the application is an application listed under section 11.3 of the DA Rules.

Further advice about information requests is contained in the <u>DA Forms Guide</u>.

## PART 7 – FURTHER DETAILS

20) Are there any associated development applications or current approvals? (e.g. a preliminary approval)			
<ul> <li>Yes – provide details below or include details in a schedule to this development application</li> <li>No</li> </ul>			
List of approval/development application references	Reference number	Date	Assessment manager
Approval	8/37/79(2372305)	2009	Douglas Shire Council
Approval     Development application			

21) Has the portable long service leave levy been paid? (only applicable to development applications involving building work or operational work)				
Yes – a copy of the receipted	Yes – a copy of the receipted QLeave form is attached to this development application			
<ul> <li>No – I, the applicant will provide evidence that the portable long service leave levy has been paid before the assessment manager decides the development application. I acknowledge that the assessment manager may give a development approval only if I provide evidence that the portable long service leave levy has been paid</li> <li>Not applicable (e.g. building and construction work is less than \$150,000 excluding GST)</li> </ul>				
Amount paid         Date paid (dd/mm/yy)         QLeave levy number (A, B or E)		QLeave levy number (A, B or E)		
\$				

22) Is this development application in response to a show cause notice or required as a result of an enforcement notice?

 $\Box$  Yes – show cause or enforcement notice is attached  $\boxtimes$  No

#### 23) Further legislative requirements

**Environmentally relevant activities** 

23.1) Is this development application also taken to be an application for an environmental authority for an **Environmentally Relevant Activity (ERA)** under section 115 of the *Environmental Protection Act 1994*?

Yes – the required attachment (form ESR/2015/1791) for an application for an environmental authority accompanies this development application, and details are provided in the table below				
🖾 No				
<b>Note:</b> Application for an environment requires an environmental authority		ing "ESR/2015/1791" as a search tern <u>ov.au</u> for further information.	n at <u>www.qld.gov.au</u> . An ERA	
Proposed ERA number:		Proposed ERA threshold:		
Proposed ERA name:				
Multiple ERAs are applicable to this development application and the details have been attached in a schedule to this development application.				
Hazardous chemical facilities				
23.2) Is this development application for a hazardous chemical facility?				
Yes – Form 69: Notification of a facility exceeding 10% of schedule 15 threshold is attached to this development application				

🛛 No

Note: See <u>www.business.qld.gov.au</u> for further information about hazardous chemical notifications.

Clearing native vegetation
23.3) Does this development application involve <b>clearing native vegetation</b> that requires written confirmation that the chief executive of the <i>Vegetation Management Act 1999</i> is satisfied the clearing is for a relevant purpose under section 22A of the <i>Vegetation Management Act 1999</i> ?
<ul> <li>Yes – this development application includes written confirmation from the chief executive of the Vegetation Management Act 1999 (s22A determination)</li> </ul>
<ul> <li>No</li> <li>Note: 1. Where a development application for operational work or material change of use requires a s22A determination and this is not included, the development application is prohibited development.</li> <li>2. See <u>https://www.qld.gov.au/environment/land/vegetation/applying</u> for further information on how to obtain a s22A determination.</li> </ul>
Environmental offsets
23.4) Is this development application taken to be a prescribed activity that may have a significant residual impact on a <b>prescribed environmental matter</b> under the <i>Environmental Offsets Act 2014</i> ?
<ul> <li>Yes – I acknowledge that an environmental offset must be provided for any prescribed activity assessed as having a significant residual impact on a prescribed environmental matter</li> <li>No</li> </ul>
<b>Note</b> : The environmental offset section of the Queensland Government's website can be accessed at <u>www.qld.gov.au</u> for further information on environmental offsets.
Koala habitat in SEQ Region
23.5) Does this development application involve a material change of use, reconfiguring a lot or operational work which is assessable development under Schedule 10, Part 10 of the Planning Regulation 2017?
<ul> <li>Yes – the development application involves premises in the koala habitat area in the koala priority area</li> <li>Yes – the development application involves premises in the koala habitat area outside the koala priority area</li> </ul>
No Note: If a koala habitat area determination has been obtained for this premises and is current over the land, it should be provided as part of this development application. See koala habitat area guidance materials at <u>www.des.qld.gov.au</u> for further information.
Water resources
23.6) Does this development application involve taking or interfering with underground water through an artesian or subartesian bore, taking or interfering with water in a watercourse, lake or spring, or taking overland flow water under the <i>Water Act 2000</i> ?
Yes – the relevant template is completed and attached to this development application and I acknowledge that a relevant authorisation or licence under the <i>Water Act 2000</i> may be required prior to commencing development
No Note: Contact the Department of Natural Resources, Mines and Energy at www.dnrme.gld.gov.au for further information.
DA templates are available from https://planning.dsdmip.gld.gov.au/. If the development application involves:
Taking or interfering with underground water through an artesian or subartesian bore: complete DA Form 1 Template 1
<ul> <li>Taking or interfering with water in a watercourse, lake or spring: complete DA Form1 Template 2</li> <li>Taking overland flow water: complete DA Form 1 Template 3.</li> </ul>
Waterway barrier works
23.7) Does this application involve waterway barrier works?
<ul> <li>Yes – the relevant template is completed and attached to this development application</li> <li>No</li> </ul>
DA templates are available from <a href="https://planning.dsdmip.gld.gov.au/">https://planning.dsdmip.gld.gov.au/</a> . For a development application involving waterway barrier works, complete DA Form 1 Template 4.
Marine activities
23.8) Does this development application involve aquaculture, works within a declared fish habitat area or removal, disturbance or destruction of marine plants?
Yes – an associated <i>resource</i> allocation authority is attached to this development application, if required under the <i>Fisheries Act 1994</i>
No Note: See guidance materials at <u>www.daf.gld.gov.au</u> for further information.

Quarry materials from a watercourse or lake			
23.9) Does this development application involve the <b>removal of quarry materials from a watercourse or lake</b> under the <i>Water Act 2000?</i>			
No	<ul> <li>Yes – I acknowledge that a quarry material allocation notice must be obtained prior to commencing development</li> <li>No</li> <li>Note: Contact the Department of Natural Resources, Mines and Energy at <u>www.dnrme.gld.gov.au</u> and <u>www.business.gld.gov.au</u> for further</li> </ul>		
information.	and mesources, mines and Energy	ar <u>www.unime.qid.gov.aa</u> ana <u>www.</u>	<u>Jusiness.qid.gov.au</u> ioi iuriner
Quarry materials from land	under tidal waters		
23.10) Does this development under the <i>Coastal Protection</i>		oval of quarry materials from	m land under tidal water
<ul> <li>☐ Yes – I acknowledge that a</li> <li>☑ No</li> </ul>			o commencing development
Note: Contact the Department of Env	vironment and Science at <u>www.des.</u>	<u>qld.gov.au</u> for further information.	
Referable dams			
23.11) Does this development section 343 of the <i>Water Sup</i>	ply (Safety and Reliability) A	ct 2008 (the Water Supply Act	t)?
<ul> <li>Yes – the 'Notice Acceptin Supply Act is attached to the No</li> </ul>	g a Failure Impact Assessme his development application	ent' from the chief executive a	idministering the Water
Note: See guidance materials at www	w.dnrme.qld.gov.au for further inforr	nation.	
Tidal work or development	within a coastal manageme	ent district	
23.12) Does this development	t application involve <b>tidal wo</b>	ork or development in a coas	stal management district?
<ul> <li>Yes – the following is included with this development application:</li> <li>Evidence the proposal meets the code for assessable development that is prescribed tidal work (only required if application involves prescribed tidal work)</li> <li>A certificate of title</li> </ul>			
No Note: See guidance materials at www	w.des.ald.gov.au for further information	tion.	
Queensland and local herita	age places		
23.13) Does this development heritage register or on a place			
Yes – details of the heritage No Note: See guidance materials at www			Queensland heritage places
Name of the heritage place:	v.ucs.qu.gov.au for information req	Place ID:	
Brothels			
23.14) Does this development application involve a material change of use for a brothel?			
<ul> <li>Yes – this development application demonstrates how the proposal meets the code for a development application for a brothel under Schedule 3 of the <i>Prostitution Regulation 2014</i></li> <li>No</li> </ul>			
Decision under section 62 of	of the Transport Infrastruct	ure Act 1994	
23.15) Does this development	t application involve new or c	changed access to a state-cor	ntrolled road?
<ul> <li>Yes – this application will be taken to be an application for a decision under section 62 of the <i>Transport</i> Infrastructure Act 1994 (subject to the conditions in section 75 of the <i>Transport Infrastructure Act 1994</i> being satisfied)</li> <li>No</li> </ul>			

#### Walkable neighbourhoods assessment benchmarks under Schedule 12A of the Planning Regulation

23.16) Does this development application involve reconfiguring a lot into 2 or more lots in certain residential zones (except rural residential zones), where at least one road is created or extended?

Schedule 12A is applicable to the development application and the assessment benchmarks contained in schedule 12A have been considered

🛛 No

Note: See guidance materials at <u>www.planning.dsdmip.qld.gov.au</u> for further information.

## PART 8 – CHECKLIST AND APPLICANT DECLARATION

24) Development application checklist	
I have identified the assessment manager in question 15 and all relevant referral requirement(s) in question 17 <b>Note</b> : See the Planning Regulation 2017 for referral requirements	⊠ Yes
If building work is associated with the proposed development, Parts 4 to 6 of <u>DA Form 2 –</u> <u>Building work details</u> have been completed and attached to this development application	☐ Yes ⊠ Not applicable
Supporting information addressing any applicable assessment benchmarks is with the development application Note: This is a mandatory requirement and includes any relevant templates under question 23, a planning report and any technical reports required by the relevant categorising instruments (e.g. local government planning schemes, State Planning Policy, State Development Assessment Provisions). For further information, see <u>DA</u> Forms Guide: Planning Report Template.	⊠ Yes
Relevant plans of the development are attached to this development application <b>Note</b> : Relevant plans are required to be submitted for all aspects of this development application. For further information, see <u>DA Forms Guide: Relevant plans</u> .	⊠ Yes
The portable long service leave levy for QLeave has been paid, or will be paid before a development permit is issued (see 21)	☐ Yes ⊠ Not applicable

#### 25) Applicant declaration

- By making this development application, I declare that all information in this development application is true and correct
- Where an email address is provided in Part 1 of this form, I consent to receive future electronic communications from the assessment manager and any referral agency for the development application where written information is required or permitted pursuant to sections 11 and 12 of the *Electronic Transactions Act 2001*

Note: It is unlawful to intentionally provide false or misleading information.

**Privacy** – Personal information collected in this form will be used by the assessment manager and/or chosen assessment manager, any relevant referral agency and/or building certifier (including any professional advisers which may be engaged by those entities) while processing, assessing and deciding the development application. All information relating to this development application may be available for inspection and purchase, and/or published on the assessment manager's and/or referral agency's website.

Personal information will not be disclosed for a purpose unrelated to the *Planning Act 2016*, Planning Regulation 2017 and the DA Rules except where:

- such disclosure is in accordance with the provisions about public access to documents contained in the *Planning Act 2016* and the Planning Regulation 2017, and the access rules made under the *Planning Act 2016* and Planning Regulation 2017; or
- required by other legislation (including the Right to Information Act 2009); or
- otherwise required by law.

This information may be stored in relevant databases. The information collected will be retained as required by the *Public Records Act 2002.*

#### **1** EXECUTIVE SUMMARY

This report is submitted on behalf of *Debell Property Pty Ltd as trustee for Debell Property Trust* (the applicant) in support of a Material Change of Use (Development Permit) for a Dwelling house upon land at 1299C Mossman Daintree Road, Rocky Point legally described as Lot 4 on SP238245. Lot 2 & 3 on SP238245 is also included in the application for access purposes only.

This report addresses the merits of the proposed development with respect to the provisions of the *Douglas Shire Planning Scheme 2018* and the relevant components of the *Planning Act 2016*.

Under the *Douglas Shire Planning Scheme 2018*, the site is identified as being located within the Environmental management zone, which is intended to recognise environmentally sensitive areas and provide for houses on lots and other low impact activities where suitable. The Environmental management zone code prescribes development to be generally restricted to a Dwelling house.

The proposal seeks to establish a Dwelling house upon the subject site, delivering an anticipated use in accordance with the intent of the Environmental Management Zone. The proposal seeks to deliver a two-storey product that adopts a high-quality architectural style, with significant articulation, building recesses, modulation, as well as the use of a variation of materials and finishes to present as a development with high aesthetic value. The proposal dedicates a suitable portion of the site to landscaping to soften the built form, creating a balance between the built and natural form, positively contributing to the surrounding streetscape.

The proposal is identified as being consistent with the overall outcomes of the Environmental management zone, as the development -

- Is solely for a single residential dwelling house on a subdivided lot;
- The Dwelling house is strategically designed and sited to manage any potential environmental impacts on both the site and adjoining properties;
- Remains commensurate to pre-existing residential development in the area, with a compatible scale and design that appropriately utilises the subject allotment;
- A The proposed design results in a high quality urban design which is functional and provide generous private open space for residential living; and
- Appropriately responds to site-specific constraints, and mitigates potential natural hazards.

The proposed development provides a built form and scale that is identified as achieving the relevant assessment benchmarks applicable to the application. Overall, the proposal is identified as meeting the relevant requirements of the *Douglas Shire Planning Scheme 2018*. As such, the application should be approved subject to reasonable and relevant conditions.

#### **3 BACKGROUND & SITE CHARACTERISTICS**

#### 3.1 Site Details

Site address:	1299C Mossman Daintree Road, Rocky Point
RPD:	Lot 4 on SP238245 and Lot 2 & 3 on SP238245 for access purposes
Site area:	3,042m <sup>2</sup>

Figure 1: 1299B Mossman Daintree Road, Rocky Point

#### 3.2 Site History

As shown in Figure 1 (above), the subject site is currently vacant and is not improved by any built structures. A sealed road exists to the end of the battle-axe handle.

The subject site is a result of a residential subdivision in 2009 (Council Ref: 8/37/79(2372305)) which created 3 residential allotments and an access easement. An excerpt of the approved subdivision plan is provided further below.

The applicant seeks to establish a Dwelling house on each of the 3 allotments, however this application is limited to Lot 2 from the resultant subdivision.

It is noted that the subject development application also includes Lot 2 & 3 on SP238245 for access purposes only given the subject site requires access through Lot 2 & 3 to obtain access to Mossman Daintree Road.

Figure 2: Excerpt of approved subdivision plan

#### 3.3 Location

The subject site is located at 1299C Mossman Daintree Road, Rocky Point, formally described as Lot 4 on SP238245. In accordance with *Douglas Shire Planning Scheme 2018*, the subject site is identified within the Environmental management zone. The surrounding area is also primarily identified within the Environmental management zone and Conservation zone.

A Subject Site

**B** Environmental zone

**C** Conservation zone

Figure 3: Surrounding Zoning

#### 3.4 Site Characteristics

The subject site represents a rear allotment, 3,042m<sup>2</sup> in area currently vacant and not encumbered by existing structures. The site will obtain access to Mossman Daintree Road via a sealed road to the end of the battle-axe handle and access easment over Lot 2 & 3 on SP238245

#### Topography

The subject site possesses a significant change in level from the proposed house pad towards the rear of the site at 118m AHD to 93m at the front.

#### Flooding

*Douglas Shire Council Planning Scheme 2018* indicates the subject site is not susceptible to a flood hazard from any source.

#### Vegetation

The subject site is devoid of any significant vegetation. It is further noted the Dwelling house will be situated within an existing house pad to minimise the amount of site works required to reduce the impacts on the surrounding vegetation.

#### 3.5 Pre-Lodgement History

A Prelodgement meeting was not undertaken for the proposed development.

#### 4 **PROPOSAL**

The report is submitted in support of the proposed development for a new Dwelling house in the Environmental management zone.

#### 4.1 Proposed Design

The design of the new Dwelling house has extensively considered the character of the surrounding area through architectural form and material selection. The proposal involves the following design features:

Ground Floor								
Double car garage	Double car garage     2 x Bedrooms							
Living room	Swimming pool	Outdoor deck						
Second Floor								
<ul> <li>Living / dining</li> </ul>	Study	Kitchen						
Upper level balcony	<ul> <li>Master bedroom w/ Ensuite</li> </ul>							

The proposed dwelling is accessed via an access handle and crossover onto Mossman Daintree Road. The location of the proposed car accommodation is designed to allow for safe and efficient vehicle manoeuvring within the site and will be consistent with Council standards.

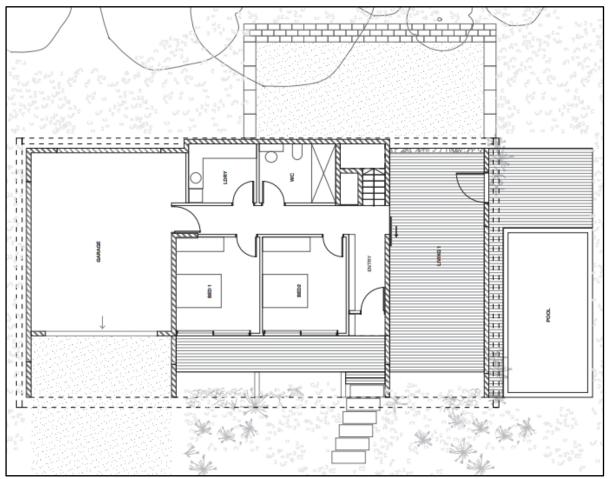

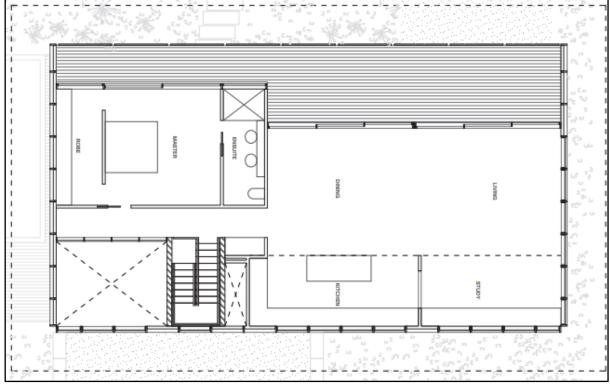

Figure 4: Ground Floor

#### Figure 5: Second Floor

#### 4.2 Building Envelope

The proposed design results in a maximum building height that is maintained under 8.5m and two (2) storeys in accordance with the Environmental management zone code. To this end, the proposed building height complies with the acceptable outcome of the *Douglas Shire Planning Scheme 2018*.

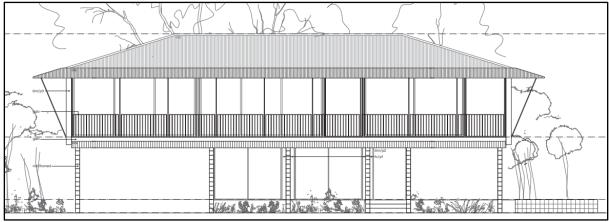

Figure 6: Side Elevation

In addition to the above, the proposed Dwelling house is strategically designed and located within the existing house pad which is centred in the lot and appropriately sited to provide generous setbacks to all boundaries. The proposed building envelope is well-located away from the property boundary and achieves the relevant setback provisions applicable under the assessment benchmarks.

vnPlan

#### 4.3 Car Parking and Access

Access to the development will be provided via the access handle and crossover from Mossman Daintree Road from the previous subdivision. It is noted that the subject development application also includes Lot 2 & 3 on SP238245 for access purposes only given the subject site requires access through Lot 2 and Lot 3 to obtain access to Mossman Daintree Road.

The driveway arrangement is suitable for access and will allow for the necessary spacing for internal manoeuvring for residents of the site. The development seeks to provide two (2) private car parking spaces in the form of a double garage. As such, the proposal provides sufficient car parking in accordance with the provisions identified under the assessment benchmarks.

#### 4.4 Natural Areas Overlay & Bushfire Hazard Overlay

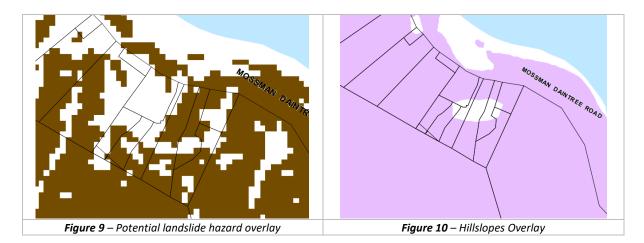

Given the site's significance within the Environmental management zone, the subject site is also encumbered by the Natural areas overlay and Bushfire hazard overlay as illustrated below in Figures 7 & 8. Notwithstanding, the proposed Dwelling house has been designed to ensure the siting and built form results in minimal impacts on the existing vegetation. The proposal will be wholly contained within the existing house pad from the previous subdivision and will not result in the removal of significant vegetation. With regards to the bushfire provisions, the Dwelling house is appropriately separated from the bushfire hazard and will utilize fitting materials to minimise any further potential risk. Please refer to the Bushfire report prepared by *Litoria* for further details.

#### 4.5 Potential Landslide Hazard Overlay & Hillslopes Overlay

In accordance with the *Douglas Shire Planning Scheme 2018*, the subject site is impacted by the Potential landslide hazard overlay and Hillslopes overlay as illustrated below in Figure 9 & 10. As such, the proposed dwelling house has been designed in accordance with consultant supporting documentation to ensure any landslide risk is appropriately mitigated and not result in further adverse impacts on the subject site and adjoining properties. Please refer to the Geotechnical report prepared by *Douglas Partners*.

#### 4.6 Infrastructure Services

The subject site is located within a rural setting and does not have direct access to reticulated sewer. Notwithstanding, the proposed Dwelling house will be supported by an onsite effluent system to service the dwelling house. Please refer to the Onsite sewerage management report prepared by *Acor Consultants*.

Similarly due to the rural setting, the subject site also has limited access to reticulated water. Notwithstanding, a suitable solution is proposed as demonstrated in the Water Pressure Evaluation Report prepared by *Acor Consultants* to ensure the Dwelling house can be appropriately serviced with water supply.

Overall, the proposal is identified as meeting the relevant requirements of the *Douglas Shire Planning Scheme 2018*. As such, the application should be approved subject to reasonable and relevant conditions.

#### 5 STATE PLANNING FRAMEWORK

#### 5.1 Planning Act 2016 – Framework

The *Planning Act 2016* provides the statutory planning framework for the State of Queensland and outlines the statutory process for preparing, assessing and deciding development applications. This proposal will be assessed in accordance with the relevant components of the *Planning Act 2016*.

The proposal will be assessed in accordance with the Development Assessment Rules under section 68(1) of the *Planning Act 2016*.

#### 5.2 State Planning Policies

A new State Planning Policy was introduced on 3 July 2017, expressing the state's interests in land use planning and development. The new State Planning Policy has replaced the existing State Planning Policy 2006.

Part E of the State Planning Policy outlines the State interest policies and assessment benchmarks. These policies and assessment benchmarks are applicable to the assessment of development applications to the extent that the new State Planning Policy has not been identified in a Planning Scheme as being appropriately integrated.

The new State Planning Policy is identified in the *Douglas Shire Planning Scheme* 2018 as being appropriately integrated. As such, an assessment of the State interest policies is not required in this instance.

#### 5.3 Referral Agency

As of 3 July 2017, the Department of State Development, Infrastructure and Planning launched the State Assessment and Referral Agency (SARA). In accordance with the *Planning Act 2016*, a Referral Agency is responsible for the assessment of development applications.

It is acknowledged that the subject site adjoins a State transport corridor, however given the Dwelling house does not require a new or changed access to the State transport corridor as thus is considered to be an excluded material change of use, as defined by Schedule 24 of the *Planning Regulation 2017*.

As such, in accordance with the *Planning Regulation 2017*, the application does not trigger any referrals.

#### 5.4 State Development Assessment Provisions

The State Development Assessment Provisions came into effect on 01 July 2013 and set out matters of interest to the State for development assessment where the State has justification as an assessment manager or referral agency. The State Development Assessment Provisions Versions 2.0 came into effect on 3 July 2017.

The State Assessment and Referral Agency is not triggered as the assessment manager or a referral agency for this application under the *Planning Regulation 2017*. As such, the State Development Assessment Provisions are not applicable to the proposal.

#### 5.5 Far North Queensland Regional Plan 2009-2031

As outlined in part 2.2 of the *Douglas Shire Planning Scheme 2018*, the planning scheme appropriately advances the *Far North Queensland Regional Plan 2009-2031*, as it applies in the planning scheme area.

Given the proposal is generally consistent with the provisions of the planning scheme, no further action is required in addressing the regional plan.

#### 6 LOCAL PLANNING FRAMEWORK

#### 6.1 Definition

The *Douglas Shire Planning Scheme 2018* defines a Dwelling house as follows:

"A residential use of premises for one household that contains a single dwelling. The use includes domestic outbuildings and works normally associated with a dwelling and may include a secondary dwelling."

In view of the above, the proposal is consistent with the definition of a Dwelling house.

#### 6.2 Level of Assessment

Under the *Douglas Shire Planning Scheme 2018*, the site is located within the Environmental management zone. In addition, the site is subject to the following Overlays:

- Acid sulfate soils overlay;
- Bushfire hazard overlay;
- Hillslopes overly;
- Natural areas overlay;
- Potential landslide hazard overlay;
- Transport network overlay.

In accordance with Part 5 of the *Douglas Shire Planning Scheme 2018*, the application is subject to Code Assessment on the following basis:

LEVEL OF ASSESSM	LEVEL OF ASSESSMENT					
ZONE						
<b>ENVIRONMENTAL</b>	MANAGEMENT ZONE					
Code Assessable	In accordance with Table 5.6.D – Levels of Assessment for Environmental management zone, a new Dwelling house is Code Assessable and subject to the assessment of various codes. As such, the application is code assessable and the Environmental management zone code and associated codes are addressed as part of this application.					
OVERLAYS						
No change	The applicable overlays mentioned above do not vary the level of assessment for the proposed Dwelling house.					

In light of the above, the prevailing level of assessment for the application is **Code Assessable**.

#### 6.3 Applicable Codes and Provisions

In accordance with Part 5 of the *Douglas Shire Planning Scheme 2018*, the following codes are identified as being applicable to the proposal:

APPLICABLE CODES					
Zone Codes	🚴 Environmental management zone code				
Use Codes	🙏 Dwelling house code				
Secondary Codes	Access, parking and servicing code				
	Filling and excavation code				
	🙏 Infrastructure code				
	Vegetation management code				
Overlay Codes	🙏 Acid sulfate soils overlay code				
	🙏 Bushfire hazard overlay code				
	🙏 Hillslopes overlay code				
	🙏 Natural areas overlay code				
	Potential landslide hazard overlay code				

The abovementioned applicable Codes have been addressed in **Appendix 1** and the attached consultant reports.

#### 7 CONCLUSION

This report is submitted on behalf of *Debell Property Pty Ltd as trustee for Debell Property Trust* (the applicant) in support of a Material Change of Use (Development Permit) for a Dwelling house upon land at 1299C Mossman Daintree Road, Rocky Point legally described as Lot 4 on SP238245. Lot 2 & 3 on SP238245 is also included in the application for access purposes only.

This report has addressed the merits of the proposed development with respect to the provisions of the *Douglas Shire Planning Scheme 2018* and the relevant components of the *Planning Act 2016*.

The proposal seeks to establish a Dwelling house upon the subject site, delivering an anticipated use in accordance with the intent of the Environmental Management Zone. The proposal seeks to deliver a two-storey product that adopts a high-quality architectural style, with significant articulation, building recesses, modulation, as well as the use of a variation of materials and finishes to present as a development with high aesthetic value. The proposal dedicates a suitable portion of the site to landscaping to soften the built form, creating a balance between the built and natural form, positively contributing to the surrounding streetscape.

Overall, the proposal is identified as meeting the relevant requirements of the *Douglas Shire Planning Scheme 2018*. As such, the application should be approved subject to reasonable and relevant conditions.

#### 3.2.2 Performance Outcomes & Acceptable Outcomes

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
For self-assessable and assessable deve	lopment		
Works on a local government road			
<b>PO1</b> Works on a local government road do not adversely impact on footpaths or existing infrastructure within the road verge and maintain the flow, safety and efficiency of pedestrians, cyclists and vehicles.	AO1.1 Footpaths/pathways are located in the road verge and are provided for the hierarchy of the road and located and designed and constructed in accordance with Planning scheme policy SC5 – FNQROC Regional Development Manual.	<b>AO1.1</b> The proposal is for a new Dwelling house on a residential lot. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
	AO1.2 Kerb ramp crossovers are constructed in accordance with Planning scheme policy SC 5 – FNQROC Regional Development Manual.	<b>AO1.2</b> The proposal is for a new Dwelling house on a residential lot. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
	AO1.3 New pipes, cables, conduits or other similar infrastructure required to cross existing footpaths: a) are installed via trenchless	<b>AO1.3</b> The proposal is for a new Dwelling house on a residential lot. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
	<ul> <li>methods; or</li> <li>b) where footpath infrastructure is removed to install infrastructure, the new section of footpath is installed to the standard detailed in the Planning scheme policy SC5 – FNQROC Regional Development Manual, and is not less than a 1.2 metre section.</li> <li>AO1.4</li> <li>Where existing footpaths are damaged as a result of development, footpaths are reinstated ensuring: <ul> <li>a) similar surface finishes are used;</li> <li>b) there is no change in level at joins of new and existing sections;</li> <li>c) new sections are matched to existing in terms of dimension and reinforcement.</li> </ul> </li> </ul>	A01.4 The proposal is for a new Dwelling house on a residential lot. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
	AO1.5 Decks, verandahs, stairs, posts and other structures located in the road reserve do not restrict or impede pedestrian movement on footpaths or change the level of the road verges.	AO1.5 The proposal is for a new Dwelling house on a residential lot. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
Accessibility structures			T
PO2 Development is designed to ensure it is accessible for people of all abilities and accessibility features do not	AO2.1 Accessibility structures are not located within the road reserve.	<b>AO2.1</b> The proposal is for a new Dwelling house on a residential lot. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
impact on the efficient and safe use of footpaths.	AO2.2 Accessibility structures are designed in	AO2.2 The proposal is for a new Dwelling house on	□Compliant
	accordance with AS1428.3.	a residential lot. As such, this criterion is not applicable.	<ul> <li>☑ N/A</li> <li>□ Performance Solution</li> </ul>
	A02.3	A02.3	
	When retrofitting accessibility features in existing buildings, all structures and changes in grade are contained within the boundaries of the lot and not within the road reserve.	The proposal is for a new Dwelling house on a residential lot. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
Water supply			
<b>PO3</b> An adequate, safe and reliable supply of potable, fire fighting and general use water is provided.	AO3.1 The premises is connected to Council's reticulated water supply system in accordance with the Design Guidelines set out in Section D6 of the Planning scheme policy SC5 – FNQROC Regional Development Manual;	<b>AO3.1</b> Please refer to the Water pressure evaluation report submitted as part of the application.	⊠Compliant □N/A □Performance Solution
	<b>AO3.2</b> Where a reticulated water supply system is not available to the premises, on site water storage tank/s with a minimum capacity of 10,000 litres of stored water, with a minimum 7,500 litre tank, with the balance from other sources (e.g. accessible swimming pool, dam etc.) and access to the tank/s for fire trucks is provided for each	<b>AO3.2</b> Please refer to the Water pressure evaluation report submitted as part of the application.	⊠Compliant □N/A □Performance Solution

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
	new house or other development. Tank/s are to be fitted with a 50mm ball valve with a camlock fitting and installed and connected prior to occupation of the house and sited to be visually unobtrusive.		
Treatment and disposal of effluent			
<b>PO4</b> Provision is made for the treatment and disposal of effluent to ensure that there are no adverse impacts on water quality and no adverse ecological impacts as a result of the system or as a result of increasing the cumulative effect of systems in the locality.	AO4.1 The site is connected to Council's sewerage system and the extension of or connection to the sewerage system is designed and constructed in accordance with the Design Guidelines set out in Section D7 of the Planning scheme policy SC5 – FNQROC Regional Development Manual;	<b>AO4.1</b> Please refer to the onsite sewerage evaluation report submitted as part of the application.	⊠Compliant □N/A □Performance Solution
	AO4.2 Where not in a sewerage scheme area, the proposed disposal system meets the requirements of Section 33 of the <i>Environmental Protection Policy (Water)</i> 1997 and the proposed on site effluent disposal system is designed in accordance with the <i>Plumbing and Drainage Act (2002)</i> .	<b>AO4.2</b> Please refer to the onsite sewerage evaluation report submitted as part of the application.	⊠Compliant □N/A □Performance Solution
Stormwater quality			
PO5 Development is planned, designed, constructed and operated to avoid or minimise adverse impacts on stormwater quality in natural and	AO5.1 A connection is provided from the premises to Council's drainage system;	AO5.1 The proposed dwelling house will be connected to Council's drainage system.	⊠Compliant □N/A □Performance Solution

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
<ul> <li>developed catchments by:</li> <li>a) achieving stormwater quality objectives;</li> <li>b) protecting water environmental values;</li> <li>c) maintaining waterway hydrology.</li> </ul>	AO5.2 An underground drainage system is constructed to convey stormwater from the premises to Council's drainage system in accordance with the Design Guidelines set out in Sections D4 and D5 of the Planning scheme policy SC5 – FNQROC Regional Development Manual.	AO5.2 The proposed dwelling house will be connected to Council's drainage system.	⊠Compliant □N/A □Performance Solution
	<ul> <li>AO5.3</li> <li>A stormwater quality management plan is prepared, and provides for achievable stormwater quality treatment measures meeting design objectives listed in Table 9.4.5.3.b and Table 9.4.5.3.c, reflecting land use constraints, such as:</li> <li>a) erosive, dispersive and/or saline soil types;</li> <li>b) landscape features (including landform);</li> <li>c) acid sulfate soil and management of nutrients of concern;</li> <li>d) rainfall erosivity.</li> </ul>	AO5.3 The proposed dwelling house will be connected to Council's drainage system.	⊠Compliant □N/A □Performance Solution
	AO5.4 Erosion and sediment control practices are designed, installed, constructed, monitored, maintained, and carried out in accordance with an erosion and sediment control plan.	<b>AO5.4</b> Erosion and sediment control practices will be carried out in accordance with an erosion and sediment control plan.	⊠Compliant □N/A □Performance Solution

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
	AO5.5 Development incorporates stormwater flow control measures to achieve the design objectives set out in Table 9.4.5.3.b and Table 9.4.5.3.c, including management of frequent flows, peak flows, and construction phase hydrological impacts.	AO5.5 The proposed dwelling house will be connected to Council's drainage system.	□Compliant □N/A □Performance Solution
Non-tidal artificial waterways			
<ul> <li>PO6</li> <li>Development involving non-tidal artificial waterways is planned, designed, constructed and operated to: <ul> <li>a) protect water environmental values;</li> <li>b) be compatible with the land use constraints for the site for protecting water environmental values;</li> <li>c) be compatible with existing tidal and non-tidal waterways;</li> </ul> </li> </ul>	<ul> <li>AO6.1</li> <li>Development involving non-tidal artificial waterways ensures:</li> <li>a) environmental values in downstream waterways are protected;</li> <li>b) any ground water recharge areas are not affected;</li> <li>c) the location of the waterway incorporates low lying areas of the catchment connected to an existing waterway;</li> <li>d) existing areas of ponded water are included.</li> </ul>	AO6.1 The proposal does not involve non-tidal artificial waterways. PO2	AO2.1	A02.1	
Development avoids disturbing potential acid sulfate soils or actual acid sulfate soils, or is managed to avoid or minimise the release of acid and metal contaminants.	<ul> <li>The disturbance of potential acid sulfate soils or actual acid sulfate soils is avoided by:</li> <li>a) not excavating, or otherwise removing, soil or sediment identified as containing potential or actual acid sulfate soils;</li> <li>b) not permanently or temporarily extracting groundwater that results in the aeration of previously saturated acid sulfate soils;</li> <li>c) not undertaking filling that results in:</li> <li>d) actual acid sulfate soils being moved below the water table;</li> <li>e) previously saturated acid sulfate soils being aerated.</li> </ul>	The proposed dwelling house requires minimal site works as the house will be located on the existing house pad.	<ul> <li>☑ Compliant</li> <li>☑ N/A</li> <li>☑ Performance Solution</li> </ul>

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
	<ul> <li>AO2.2</li> <li>The disturbance of potential acid sulfate soils or actual acid sulfate soils is undertaken in accordance with an acid sulfate soils management plan and avoids the release of metal contaminants by: <ul> <li>a) neutralising existing acidity and preventing the generation of acid and metal contaminants;</li> <li>b) preventing the release of surface or groundwater flows containing acid and metal contaminants into the environment;</li> <li>c) preventing the in situ oxidisation of potential acid sulfate soils and actual acid sulfate soils through ground water level management;</li> <li>d) appropriately treating acid sulfate soils before disposal occurs on or off site;</li> <li>e) documenting strategies and reporting requirements in an acid sulfate soils environment plan.</li> </ul> </li> </ul>	AO2.2 The proposed dwelling house requires minimal site works as the house will be located on the existing house pad.	⊠Compliant □N/A □Performance Solution
<b>PO3</b> No environmental harm is caused as a result of exposure to potential acid sulfate soils or actual acid sulfate soils.	AO3 No acceptable outcomes are prescribed.	AO3 The proposed dwelling house requires minimal site works as the house will be located on the existing house pad.	⊠Compliant □N/A □Performance Solution

## 4.2 Bushfire Hazard Overlay Code

4.2.1 Purpose

PURPO	SE & OVERALL OUTCOMES	PROPOSAL	COMPLIANCE
1) a) b) 2)	The purpose of the Bushfire overlay code is to: implement the policy direction in the Strategic Framewor (i) Theme 1 Settlement pattern: Element 3.4.7 Mit (ii) Theme 6 Infrastructure and transport: Element enable an assessment of whether development is suitable The purpose of the code will be achieved through the fol	igation of hazards; 3.9.2 Energy. e on land within the Bushfire risk overlay sub-categories.	
2) a) b) c) d) e)	<ul> <li>development avoids the establishment or intensification of vulnerable activities within or near areas that are subject to bushfire hazard;</li> <li>development is designed and located to minimise risks to people and property from bushfires;</li> <li>bushfire risk mitigation treatments are accommodated in a manner that avoids or minimises impacts on the natural environment and ecological processes;</li> <li>development involving the manufacture or storage of hazardous materials does not increase the risk to public safety or the environment in a bushfire event; development contributes to effective and efficient disaster management response and recovery capabilities.</li> </ul>	<ul> <li>a) The proposed dwelling house has been designed to avoid areas that are subject to bushfire hazard;</li> <li>b) The proposal strategically located to minimise the threat of bushfire;</li> <li>c) The development will incorporate bushfire risk mitigation treatments;</li> <li>d) The development does not involve the manufacture or storage of hazardous materials;</li> <li>e) The proposal will ensure the dwelling house has an effective and efficient disaster management response capability.</li> </ul>	⊠Compliant □N/A □Performance Solution

#### 4.2.2 Performance Outcomes & Acceptable Outcomes

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE			
For self-assessable and assessable deve	lopment					
Compatible development						
<b>PO1</b> A vulnerable use is not established or materially intensified within a bushfire hazard area (bushfire prone area) unless there is an overriding need or other exceptional circumstances.	AO1 Vulnerable uses are not established or expanded	AO1 The proposed dwelling house is appropriately located to manage the bushfire risk applicable over the site. Please refer to the bushfire report submitted as part of the application.	⊠Compliant □N/A □Performance Solution			
<b>PO2</b> Emergency services and uses providing community support services are able to function effectively during and immediately after a bushfire hazard event.	AO2 Emergency Services and uses providing community support services are not located in a bushfire hazard sub-category and have direct access to low hazard evacuation routes.	AO2 The proposal is for a dwelling house. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution			
<b>PO3</b> Development involving hazardous materials manufactured or stored in bulk is not located in bushfire hazard sub-category.	AO3 The manufacture or storage of hazardous material in bulk does not occur within bushfire hazard sub-category.	AO3 The proposal does not involve the manufacture or storage of hazardous materials.	□Compliant ⊠N/A □Performance Solution			
Development design and separation from bushfire hazard – reconfiguration of lots						
<b>PO4.1</b> Where reconfiguration is undertaken in an urban area or is for urban purposes or smaller scale rural residential purposes, a separation distance from hazardous vegetation is provided to	<b>AO4.1</b> No new lots are created within a bushfire hazard sub-category.	<b>AO4.1</b> The proposal is for a dwelling house. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution			

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
achieve a radiant heat flux level of $29$ kW/m <sup>2</sup> at the edge of the proposed lot(s).			
PO4.2	AO4.2	AO4.2	
Where reconfiguration is undertaken for other purposes, a building envelope of reasonable dimensions is provided on each lot which achieves radiant heat flux level of 29kW/m2 at any point.	<ul> <li>Lots are separated from hazardous vegetation by a distance that:</li> <li>a) achieves radiant heat flux level of 29kW/m<sup>2</sup> at all boundaries; and</li> <li>b) is contained wholly within the development site.</li> </ul>	The proposal is for a dwelling house. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
PO5	A05.1	A05.1	
Where reconfiguration is undertaken in an urban area or is for urban purposes, a constructed perimeter road with reticulated water supply is established between the lots and the hazardous vegetation and is readily accessible at all times for urban fire fighting vehicles. The access is available for both fire fighting and maintenance/defensive works.	<ul> <li>Lot boundaries are separated from hazardous vegetation by a public road which:</li> <li>a) has a two lane sealed carriageway;</li> <li>b) contains a reticulated water supply;</li> <li>c) is connected to other public roads at both ends and at intervals of no more than 500m;</li> <li>d) accommodates geometry and turning radii in accordance with Queensland Fire and Emergency Services' Fire Hydrant and Vehicle Access Guidelines;</li> <li>e) has a minimum of 4.8m vertical clearance above the road;</li> <li>f) is designed to ensure hydrants and water access points are not located within parking bay allocations; and</li> <li>g) incorporates roll-over kerbing.</li> </ul>	The proposal is for a dwelling house. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
	A05.2	A05.2	
	Fire hydrants are designed and installed in accordance with AS2419.1 2005, unless otherwise specified by the relevant water entity.	The proposal is for a dwelling house. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
PO6	A06	A06	
Where reconfiguration is undertaken for smaller scale rural residential purposes, either a constructed	Lot boundaries are separated from hazardous vegetation by a public road or fire trail which has:	The proposal is for a dwelling house. As such, this criterion is not applicable.	□Compliant ⊠N/A
perimeter road or a formed, all weather fire trail is established	a) a reserve or easement width of at least 20m;		□Performance Solution
between the lots and the hazardous vegetation and is readily accessible at all times for the type of fire fighting vehicles servicing the area.	b) a minimum trafficable (cleared and formed) width of 4m capable of accommodating a 15 tonne vehicle and which is at least 6m clear of vegetation;		
The access is available for both fire fighting and maintenance/hazard	<ul> <li>c) no cut or fill embankments or retaining walls adjacent to the 4m wide trafficable path;</li> </ul>		
reduction works.	d) a minimum of 4.8m vertical clearance;		
	e) turning areas for fire-fighting appliances in accordance with Queensland Fire and Emergency Services' Fire Hydrant and Vehicle Access Guidelines;		
	f) a maximum gradient of 12.5%;		
	g) a cross fall of no greater than 10 degrees;		
	<ul> <li>h) drainage and erosion control devices in accordance with the standards prescribed in a planning scheme policy;</li> </ul>		
	i) vehicular access at each end which is		

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
	<ul> <li>connected to the public road network at intervals of no more than 500m;</li> <li>j) designated fire trail signage;</li> <li>k) if used, has gates locked with a system authorised by Queensland Fire and Emergency Services; and</li> <li>l) if a fire trail, has an access easement that is granted in favour of Council and Queensland Fire and Emergency Services.</li> </ul>		
P07	A07	A07	
Where reconfiguration is undertaken for other purposes, a formed, all weather fire trail is provided between the hazardous vegetation and either the lot boundary or building envelope, and is readily accessible at all times for the type of fire fighting vehicles servicing the area. However, a fire trail will not be required where it would not serve a practical fire management purpose.	<ul> <li>Lot boundaries are separated from hazardous vegetation by a public road or fire trail which has:</li> <li>a) a reserve or easement width of at least 20m;</li> <li>b) a minimum trafficable (cleared and formed) width of 4m capable of accommodating a 15 tonne vehicle and which is at least 6m clear of vegetation;</li> <li>c) no cut or fill embankments or retaining walls adjacent to the 4m wide trafficable path;</li> </ul>	The proposal is for a dwelling house. As such, this criterion is not applicable.	□Compliant ⊠N/A □Performance Solution
	<ul> <li>d) a minimum of 4.8m vertical clearance;</li> <li>e) turning areas for fire-fighting appliances in accordance with Queensland Fire and Emergency Services' Fire Hydrant and Vehicle Access Guidelines;</li> <li>f) a maximum gradient of 12.5%;</li> <li>g) a cross fall of no greater than 10</li> </ul>		

PERFORMANCE OUTCOMES	ACCEPTABLE OUTCOMES	PROPOSAL	COMPLIANCE
PO8 The development design responds to the potential threat of bushfire and establishes clear evacuation routes which demonstrate an acceptable or tolerable risk to people.	<ul> <li>degrees;</li> <li>h) drainage and erosion control devices in accordance with the standards prescribed in a planning scheme policy;</li> <li>i) vehicular access at each end which is connected to the public road network;</li> <li>j) designated fire trail signage;</li> <li>k) if used, has gates locked with a system authorised by Queensland Fire and Emergency Services; and</li> <li>l) if a fire trail, has an access easement that is granted in favour of Council and Queensland Fire and Emergency Services.</li> <li>AO8</li> <li>The lot layout:</li> <li>a) minimises the length of the development perimeter exposed to, or adjoining hazardous vegetation;</li> <li>b) avoids the creation of potential bottleneck points in the movement network;</li> <li>c) establishes direct access to a safe assembly</li> <li>d) /evacuation area in the event of an approaching bushfire; and</li> </ul>	AO8 The proposal is for a dwelling house. # Report on Geotechnical Investigation Proposed Residences Mossman Daintree Road, Rocky Point

# 1. Introduction

This report presents the results of geotechnical investigation undertaken by Douglas Partners Pty Ltd (DP) for three proposed residential dwellings at Mossman Daintree Road, Rocky Point. The investigation was commissioned in an email dated 28 April 2022 by Mr John Deicke of Office Deicke and was undertaken in accordance with DP proposal 214803.00.P.001.Rev0 dated 23 April 2022.

It is understood that the project includes the construction of three residential dwellings on separate but adjoining allotments of the subdivided 1299 Mossman Daintree Road.

The aim of the investigation was to assess the subsurface soil and groundwater conditions at the field test locations to provide:

- site classification to AS 2870 (2011);
- excavation conditions and suitable temporary and permanent batter slopes;
- site preparation earthworks and suitability of site won materials for re-use as engineered fill;
- geotechnical retaining wall design parameters;
- footing options and footing design parameters; and
- allocation of soil categories and determination of design soil permeability and design effluent loading rates based on AS 1547 (2012).

Slope risk assessment was excluded from the requested scope of work.

The investigation included the excavation of ten test pits and laboratory testing of selected samples. The details of the field and laboratory work are presented in this report, together with comments and recommendations on the items listed above.

This report must be read in conjunction with the notes entitled 'About This Report' in Appendix A and other explanatory notes, and should be kept in its entirety without separation of individual pages or sections.

## 2. Proposed Development

DP was supplied with a preliminary site plan (Drawing SD\_A01\_0101 dated 4 February 2022) for the purposes of investigation planning which is included in Appendix B for ease of reference. This plan indicated the proposed development to comprise the construction of three, two-level residential dwellings on the existing building platforms. It is assumed the buildings will be constructed using lightweight materials, elevated above ground and supported by steel posts.

# 3. Site Description

The site (designated as 1299A to 1299C Mossman Daintree Road) comprises three adjoining allotments within a battle-axe area above an existing residence (refer Drawing 1 in Appendix B and Figure 1 below). Each lot is approximately rectangular in shape, and comprising an area of  $3042 \text{ m}^2$  (Lots 3 and 4) or  $4092 \text{ m}^2$  (Lot 2). For the purposes of this report, 'site' refers to the combined area of the three allotments.

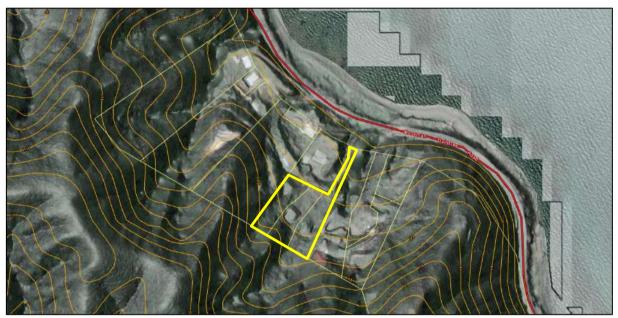

Figure 1: Qld Globe image showing site location in yellow outline.

The site is situated on the north-eastern facing foot slopes of the Dagmar Range and site elevations approximately range from 35 AHD to 55 AHD. Much of the southwestern portion of the site (approximately 25%) comprises steeply sloping hillside vegetated by dense rainforest.

Previous earthworks are evident on site including the preparation of building platforms using 'cut to fill' methodology, and an open unlined drain has been excavated along much of the site's eastern boundary, presumably to divert overland flows down to the road reserve. No structures were observed within site boundaries and other than that for the above earthworks, it appears that no previous site development has occurred.

The main portion of the site, below the south-western steep slopes, has mostly been cleared of native vegetation and is generally vegetated by short grass with several large trees and shrubs present mostly around the building platforms (refer Figures 2 to 5). The terrain in the cleared portions is generally uneven and hummocky, and the building platforms appear to have been created by localised cutting and filling. The natural slope gradients downhill of the of the building platforms generally range between 10° to 15°(ie 'moderately' sloping).

The site is bordered by residential properties downhill to the north, east and west, and steeply sloping, densely vegetated slopes uphill to the south.

Figure 2: Showing general site conditions. Photo is from the end of the shared driveway with a view towards the southwest.

Figure 3: View looking northeast showing the building platform at 1299A.

Figure 4: View looking northeast showing the building platform at 1299B.

Figure 5: View looking west showing the building platform at 1299C.

## 4. Geology

Reference to the Mossman 1:100,000 Geological Series Sheet (Department of Mines and Energy, 1999) indicates that the site is underlain by Hodgkinson Formation bedrock typically comprising siltstone and fine to coarse grained arenite, and residual soils thereof.

Investigation findings are generally consistent with the published findings however colluvial materials were commonly encountered, generally overlying residual soils in the majority of the test locations.

## 5. Field Work

### 5.1 Methods

The field work was completed on 4 May 2022 and comprised the excavation of ten test pits, designated as Pits 1 to 10, to depths ranging from 1.7 m to 3.9 m. Approximate test locations are shown on Drawing 1 in Appendix B.

The pits were excavated using a 5.5 tonne excavator. Strata identification was through observation of excavated spoil, and soil samples were taken at regular depth intervals for laboratory testing. Pocket penetrometer readings were taken in the walls of the pits and dynamic cone penetrometer (DCP) tests were undertaken alongside the pits to provide additional information for assessment of soil strength consistency. On completion of excavation, the pits were backfilled with excavated spoil in layers which were nominally compacted using the back of the excavator bucket. Any excess spoil was mounded and track rolled at the surface.

The field work was carried out in the presence of a DP engineering geologist.

A differential GPS unit was used to record UTM co-ordinates to GDA94. Surface levels were extrapolated from a supplied contour drawing. The co-ordinates and surface levels are presented on the test pit logs in Appendix D.

### 5.2 Results

The subsurface conditions encountered in the pits are detailed on the logs in Appendix D. Notes defining the sampling methods, soil descriptions, and symbols and abbreviations used in their preparation are given in Appendix A.

Subsurface conditions may be grouped into two areas for discussion, the building platform (ie modified) areas and downslope (ie natural) areas.

Fill, comprising medium dense clayey sandy gravel (similar to the naturally occurring colluvium encountered elsewhere on site) was encountered in Pits 2, 4 and 6 to depths of between 1.2 m and 2.2 m.

Natural materials encountered within the majority of the building platform test locations, either below the fill or from the surface (refer Pits 1, 2 and 4 to 6) are broadly characterised by colluvial clayey or silty

sandy gravel with cobbles (generally assessed to be medium dense or denser), underlain in Pits 5 and 6 by stiff or stronger residual clayey silt, transitioning to weathered siltstone within which virtual excavator refusal occurred on probable very low strength or stronger rock. Colluvium was not encountered in Pit 3, which encountered hard, residual clayey silt to 1.5 m depth, overlying siltstone to virtual excavator refusal at 1.7 m depth.

Within the downslope hillside test locations (refer Pits 7 to 10), ground conditions generally comprised a shallow (0.15 m or 0.2 m thick) layer of firm or stronger clayey silt topsoil overlying stiff or stronger clayey silt. The exception to this generalised profile description was the presence of very stiff silty clay encountered below 1.5 m depth in Pit 7, to the limit of investigation.

Free groundwater was not observed in any of the test pits, however it should be noted that groundwater depths and ground moisture conditions are affected by climatic conditions, soil permeability and human influences, and will therefore vary with time. Rocky Point is in the wet tropics and subject to wet and dry seasons, during which the groundwater levels may be prone to vary considerably.

Deeply eroded ephemeral water courses / surface drains were observed to the east and north of site indicating the likelihood of significant overland flows during and following significant rainfall events.

## 6. Laboratory Testing

#### **Geotechnical Laboratory Testing** 6.1

Geotechnical laboratory testing comprised:

- Atterberg limits, linear shrinkage, and field moisture content (three tests); and
- Particle size distribution, greater than 0.075 mm (two tests).

Geotechnical laboratory results are summarised in Tables 1 and 2, with laboratory certificates presented in Appendix E.

Pit	Depth (m)	Primary Description	FMC (%)	LL (%)	PL (%)	PI (%)	LS (%)
4	0.5	Clayey Sandy GRAVEL	18.1	28	23	5	3.5
5	1.0	Clayey SILT	18.0	34	23	11	4.5
8	0.3	Clayey SILT	14.7	24	19	5	2.5
Notes to				_ '	.0	•	2.0

### Table 1: Results of Laboratory Testing – Field Moisture, Atterberg Limits and Linear Shrinkage

FMC - Field Moisture Content LL - Liquid Limit

PL - Plastic Limit

PI - Plasticity Index LS - Linear Shrinkage

Pit	Depth (m)	Primary Description	Gravel (%)	Sand (%)	Silt and clay (%)
1	0.4	Clayey Sandy GRAVEL	38	30	32
4	0.5	Clayey GRAVEL	52	19	29

### Table 2: Results of Laboratory Testing - Gradings

### 6.2 Effluent Disposal Laboratory Testing

Effluent disposal laboratory testing comprised:

- Emerson class number, soil pH, electrical conductivity (EC), cation exchange capacity (three tests); and
- total nitrogen, sodium adsorption ratio, phosphorous absorption capacity (three tests).

Effluent disposal laboratory results are summarised in Tables 3 and 4, with laboratory certificates presented in Appendix E.

Pit	Depth (m)	Primary Description	Soil pH 1:5	EC (µS/cm)	Phosphorous Sorption Capacity (mgP/kg)	Total Nitrogen in Soil (mg/kg)	Sodium Adsorption Ratio	Emerson Class Number
7	1.7	Silty CLAY	5.9	48	670	170	1.2	5
9	1.5	Clayey SILT	5.2	51	560	180	1.8	6
10	1.0	Clayey SILT	5.4	45	530	270	0.56	5

Table 3: Results of pH, EC, Phosphorous Ssorption and Emerson Class Number Testing

### Table 4: Results of Cation Exchange Capacity Testing

Pit	Depth (m)	Description	Calcium (meq%)	Potassium (meq%)	Magnesium (meq%)	Sodium (meq%)	CEC (meq%)	ESP (%)
7	1.7	Silty CLAY	0.2	<0.1	0.1	<0.1	<1	<1
9	1.5	Clayey SILT	0.1	<0.1	<0.1	<0.1	<1	<1
10	1.0	Clayey SILT	0.5	<0.1	0.2	<0.1	<1	<1

Legend:

CEC – cation exchange capacity

ESP - exchangeable sodium percentage

# 7. Comments

## 7.1 Appreciation of Site Geotechnical Conditions

The natural ground conditions at the field test locations are generally characterised as comprising medium dense or denser colluvial soils consisting of varying proportions of clayey silt, sand, gravel and cobbles, generally overlying residual stiff or stronger clayey silt transitioning with depth to weathered siltstone bedrock. Fill of similar properties to the colluvial soils was encountered to depths of between 1.2 m and 2.2 m within the north-western portions of each of the building platforms. It is assumed that the fill has been site-won from the uphill (south-western) sides of the building platform areas.

In isolation of upslope instability risk, the assessment of which was not requested by the client but is assumed to have been completed by others, the primary geohazard for this project is anticipated to be that of the existing uncontrolled fill, which should not be relied upon for structural support. The design of on-site effluent disposal systems should only be undertaken by appropriately experienced personnel familiar with the site and climatic conditions, giving particular consideration to hydraulic balance during the wet season.

Further comments on design and construction are given in the following sections of the report.

## 7.2 Site Classification

AS 2870 (2011) states that site classification is based on expected ground surface movement. Surface movement is usually due to soil reactivity under normal moisture conditions, however in some cases the level of ground movement may be controlled by other factors. Sites where ground movements may be significantly affected by factors other than reactive soil movements under normal moisture conditions are classified as 'Class P' under the standard and footing design must by based on engineering principles.

AS2870 (2011) provides a list of scenarios that would require a 'Class P' classification, including the presence of 'uncontrolled' fill, which applies to the existing building platforms in their current conditions.

## 7.3 Excavation Conditions

Excavations for high level footings and trenches for effluent disposal are anticipated to encounter either colluvial clayey/silty sandy gravel or residual clayey silt transitioning to very low strength weathered siltstone. It is considered that the colluvial and residual soils should be readily excavatable by standard small sized (ie 12 - 20 tonne) earthmoving equipment. Ripping would likely be required for excavations within low strength or stronger siltstone, depending on fracturing and strength variability.

### 7.4 Batter Slopes

Short-term temporary batter slopes of 1.5H:1V are suggested for unsurcharged, dry, temporary excavations in natural in-situ soils or existing fill up to 3 m deep. Permanent batter slope angles of no steeper than 3H:1V are suggested, with steeper slopes requiring additional geotechnical assessment, possibly requiring the construction of engineer designed retaining walls (refer Section 7.6).

Stockpiles or heavy plant should not be placed near the batter crests, as this may instigate slope failure. Further advice should be sought from DP if such surcharge is located within the batter vertical height laterally behind the crest.

Surface runoff should be diverted away from the crests and toes of the batters to reduce the potential for scour erosion. It is also recommended that all batters incorporate crest and toe drains and be appropriately vegetated with respect to erosion control.

### 7.5 Site Preparation

It is suggested that site preparation and fill for the support of ground slabs, pavements and upper level footings be carried out in accordance with the following guidelines::

- Remove all existing uncontrolled fill, surface vegetation, organic topsoil, and any deleterious soft, wet or highly compressible material;.
- Tine the subgrade and adjust the moisture content to within 2% of optimum moisture content for standard compaction (SOMC);
- Compact the subgrade with at least six passes of a minimum 12 t static weight smooth drum roller. Test roll the compacted subgrade under careful inspection by a geotechnical engineer to detect any remaining relatively soft or loose zones, which should be excavated out and replaced with approved engineered fill under 'Level 1' inspection and testing;
- If additional fill is required, place approved engineered fill in layers not exceeding 200 mm loose thickness, and compact to at least 98% standard dry density ratio or density index of at least 75%. Moisture contents within cohesive fill should be maintained within 2% of SOMC, during and after compaction; and
- Undertake 'Level 1' inspection and testing for all additional fill placement works, in accordance with AS 3798 (2007).

It is important to note that dry, over-compacted cohesive fill or cohesive subgrade (ie compacted to move than 102% SMDD and dry of OMC) is generally more prone to swelling and softening. For this reason, fill compaction and moisture should be carefully controlled on site, with both compaction and moisture control criteria included in the bulk earthworks specification.

Fill placement and compaction under 'Level 1' inspection and testing in accordance with AS 3798 (2007), is required where structural loads are to be supported by fill. A 'Level 1' inspection and test report must also be prepared at the completion of the works stating that the fill has been completed as recommended above and as required by AS 3798 (2007).

### 7.6 Retaining Walls

Table 5 presents lateral earth pressure, bulk density and sliding coefficient for the various soils encountered.

Material	Strength Consistency /Relative Density	Ka	Ко	Кр	Bulk Unit Weight (kN/m³)	tanδ⁵	
Clayey Silt / Silty Clay	Stiff	0.4	0.55	2.5	18	0.3	
	Very stiff or hard	0.4	0.55	2.5	20		
Granular	Medium dense (or denser)	0.28	0.45	3.5	20	0.4	

Notes: \* for concrete cast directly onto the clean soil surface

For design of retaining walls, due allowance should be made for the following:

- Surcharge loadings (over and above the lateral earth pressure coefficients presented above) where the finished ground level above retaining walls is above horizontal and where additional loading is likely to be applied from existing or future upslope structures, or from traffic.
- Drainage material installed for the full height behind the wall, to a width of at least 0.3 m. The material must be free draining and granular and have a perforated or slotted drainage pipe at the heel of the wall to rapidly remove the water into the stormwater system. If drainage is not provided, the wall loading caused by flooding or inundation, must be considered. Such flooding may penetrate up to 0.9 m depth into cracks behind the wall and result in a hydrostatic load.

Care should be taken when placing soils behind retaining walls, to reduce the risk of damage associated with the use of heavy compaction plant and swelling. Compaction should not exceed 95% to 98% standard maximum dry density ratio and all filling should be placed within 2% of OMC.

It is recommended that factors of safety of 2 against overturning and sliding stability and 1.5 for global stability, be adopted in the design of all retaining walls.

For limit state design methods, the ultimate parameters provided above in Table 5 will need to be factored in accordance with (AS 4678, 2002). Guidance on the selection of material strength partial factors is provided in Section 5.2 of (AS 4678, 2002) and is dependent upon the nature and state of the natural in-situ soil.

## 7.7 Footings

High level pad and strip footings up to 1 m and 0.6 m wide, respectively, founding in 'controlled' fill, medium dense or denser colluvium or stiff or stronger clayey silt may be sized for a maximum allowable bearing pressure of 100 kPa.

Settlements of approximately 10 mm to 15 mm are estimated for properly designed and constructed pad or strip footings dimensioned and supported as above. Wider footings are possible but would be subject to specific settlement assessment.

### 7.8 Soil and Site Assessment

The suitability of the site to accept effluent is dependent on a number of factors, including:

- the subsurface profile (soil and groundwater) within the proposed application area;
- the type and output nutrient quality of the treatment system utilised;
- the physical characteristics such as topography, landform, distances to water bodies, etc; and
- prevailing climatic conditions.

The controlling soil for on-site effluent disposal by traditional systems is likely to be the residual clayey silt due to its low permeability and poor soil structure. Based on Table 5.1 of (AS 1547, 2012), for a weakly structured Category 4 soil an indicative permeability of between 0.12 and 0.5 m/day is suggested.

Site and soil characteristics observed during the field work are assigned either a minor, moderate or major limitation depending on the restrictions to the disposal area in accordance with (AS 1547, 2012). The moderate/major limitations for effluent disposal within the site are shown below. Soil and site assessment summaries are provided in Appendix C.

### Cation Exchange Capacity (CEC)

The CEC results of <1 meq% fall into the major limitation category due to the inability of these soils to hold plant nutrients.

### Soil pH

Soil pH test results of 5.2 and 5.4 fall into the moderate limitation category due to non-optimal plant growth conditions.

### Slope Angle

Slope angle of between 10° and 20° (approximately 20% to 40% grade) is a major limiting factor for all disposal systems due to the risk of runoff.

### Landform and Site Drainage

The site topography presents a moderate risk of groundwater pollution and transport of waste offsite.

### Upslope seepage

The run on and upslope seepage potential is a moderate risk due to transport of wastewater off site.

## 7.9 Design Effluent Loading Rates

For Category 4 soil it is recommended that the effluent design loading rates and design irrigation rates (DLR/DIR) as presented below in Table 6 be adopted, based on (AS 1547, 2012).

Table 6: Effluent Design Loading / Irrigation Rates

Dispessel System	Effluent Design Loading / Irrigation Rates			
Disposal System	Primary Treated Effluent	Secondary Treated Effluent		
Conventional Trenches or Beds	6 to 10 mm/day	20 mm/day		
Evapotranspiration/absorption (ETA/ETS) system	8 mm/day			
Irrigation System – Drip or spray	3.5 mm/day <sup>A</sup>			
Irrigation System – Low pressure effluent distribution (LPED)	3 mm/day			
Mound System	8 mm/day			

Notes: A requires a minimum of 150 mm of high-quality topsoil

## 8. Limitations

Douglas Partners Pty Ltd (DP) has prepared this report for this project at 1299 Mossman Daintree Road in accordance with DP's proposal dated 23 April 2022 and acceptance received from John Deicke dated 28 April 2022. The work was carried out under DP's Conditions of Engagement. This report is provided for the exclusive use of Office Deicke for this project only and for the purposes as described in the report. It should not be used by or relied upon for other projects or purposes on the same or other site or by a third party. Any party so relying upon this report beyond its exclusive use and purpose as stated above, and without the express written consent of DP, does so entirely at its own risk and without recourse to DP for any loss or damage. In preparing this report DP has necessarily relied upon information provided by the client and/or their agents.

The results provided in the report are indicative of the sub-surface conditions on the site only at the specific sampling and/or testing locations, and then only to the depths investigated and at the time the work was carried out. Sub-surface conditions can change abruptly due to variable geological processes and also as a result of human influences. Such changes may occur after DP's field testing has been completed.

DP's advice is based upon the conditions encountered during this investigation. The accuracy of the advice provided by DP in this report may be affected by undetected variations in ground conditions across the site between and beyond the sampling and/or testing locations.

The assessment of atypical safety hazards arising from this advice is restricted to the geotechnical components set out in this report and based on known project conditions and stated design advice and assumptions. While some recommendations for safe controls may be provided, detailed 'safety in design' assessment is outside the current scope of this report and requires additional project data and assessment.

This report must be read in conjunction with all of the attached and should be kept in its entirety without separation of individual pages or sections. DP cannot be held responsible for interpretations or conclusions made by others unless they are supported by an expressed statement, interpretation, outcome or conclusion stated in this report.

This report, or sections from this report, should not be used as part of a specification for a project, without review and agreement by DP. This is because this report has been written as advice and opinion rather than instructions for construction.

The scope of work for this investigation/report did not include the assessment of surface or sub-surface materials or groundwater for contaminants, within or adjacent to the site. Should evidence of fill of unknown origin be noted in the report, and in particular the presence of building demolition materials, it should be recognised that there may be some risk that such fill may contain contaminants and hazardous building materials.

# Appendix A

About This Report

#### Introduction

These notes have been provided to amplify DP's report in regard to classification methods, field procedures and the comments section. Not all are necessarily relevant to all reports.

DP's reports are based on information gained from limited subsurface excavations and sampling, supplemented by knowledge of local geology and experience. For this reason, they must be regarded as interpretive rather than factual documents, limited to some extent by the scope of information on which they rely.

### Copyright

This report is the property of Douglas Partners Pty Ltd. The report may only be used for the purpose for which it was commissioned and in accordance with the Conditions of Engagement for the commission supplied at the time of proposal. Unauthorised use of this report in any form whatsoever is prohibited.

### **Borehole and Test Pit Logs**

The borehole and test pit logs presented in this report are an engineering and/or geological interpretation of the subsurface conditions, and their reliability will depend to some extent on frequency of sampling and the method of drilling or excavation. Ideally, continuous undisturbed sampling or core drilling will provide the most reliable assessment, but this is not always practicable or possible to justify on economic grounds. In any case the boreholes and test pits represent only a very small sample of the total subsurface profile.

Interpretation of the information and its application to design and construction should therefore take into account the spacing of boreholes or pits, the frequency of sampling, and the possibility of other than 'straight line' variations between the test locations.

### Groundwater

Where groundwater levels are measured in boreholes there are several potential problems, namely:

 In low permeability soils groundwater may enter the hole very slowly or perhaps not at all during the time the hole is left open;

- A localised, perched water table may lead to an erroneous indication of the true water table;
- Water table levels will vary from time to time with seasons or recent weather changes. They may not be the same at the time of construction as are indicated in the report; and
- The use of water or mud as a drilling fluid will mask any groundwater inflow. Water has to be blown out of the hole and drilling mud must first be washed out of the hole if water measurements are to be made.

More reliable measurements can be made by installing standpipes which are read at intervals over several days, or perhaps weeks for low permeability soils. Piezometers, sealed in a particular stratum, may be advisable in low permeability soils or where there may be interference from a perched water table.

### Reports

The report has been prepared by qualified personnel, is based on the information obtained from field and laboratory testing, and has been undertaken to current engineering standards of interpretation and analysis. Where the report has been prepared for a specific design proposal, the information and interpretation may not be relevant if the design proposal is changed. If this happens, DP will be pleased to review the report and the sufficiency of the investigation work.

Every care is taken with the report as it relates to interpretation of subsurface conditions, discussion of geotechnical and environmental aspects, and recommendations or suggestions for design and construction. However, DP cannot always anticipate or assume responsibility for:

- Unexpected variations in ground conditions. The potential for this will depend partly on borehole or pit spacing and sampling frequency;
- Changes in policy or interpretations of policy by statutory authorities; or
- The actions of contractors responding to commercial pressures.

If these occur, DP will be pleased to assist with investigations or advice to resolve the matter.

# About this Report

#### **Site Anomalies**

In the event that conditions encountered on site during construction appear to vary from those which were expected from the information contained in the report, DP requests that it be immediately notified. Most problems are much more readily resolved when conditions are exposed rather than at some later stage, well after the event.

### Information for Contractual Purposes

Where information obtained from this report is provided for tendering purposes, it is recommended that all information, including the written report and discussion, be made available. In circumstances where the discussion or comments section is not relevant to the contractual situation, it may be appropriate to prepare a specially edited document. DP would be pleased to assist in this regard and/or to make additional report copies available for contract purposes at a nominal charge.

#### **Site Inspection**

The company will always be pleased to provide engineering inspection services for geotechnical and environmental aspects of work to which this report is related. This could range from a site visit to confirm that conditions exposed are as expected, to full time engineering presence on site.

### Sampling

Sampling is carried out during drilling or test pitting to allow engineering examination (and laboratory testing where required) of the soil or rock.

Disturbed samples taken during drilling provide information on colour, type, inclusions and, depending upon the degree of disturbance, some information on strength and structure.

Undisturbed samples are taken by pushing a thinwalled sample tube into the soil and withdrawing it to obtain a sample of the soil in a relatively undisturbed state. Such samples yield information on structure and strength, and are necessary for laboratory determination of shear strength and compressibility. Undisturbed sampling is generally effective only in cohesive soils.

### **Test Pits**

Test pits are usually excavated with a backhoe or an excavator, allowing close examination of the insitu soil if it is safe to enter into the pit. The depth of excavation is limited to about 3 m for a backhoe and up to 6 m for a large excavator. A potential disadvantage of this investigation method is the larger area of disturbance to the site.

### Large Diameter Augers

Boreholes can be drilled using a rotating plate or short spiral auger, generally 300 mm or larger in diameter commonly mounted on a standard piling rig. The cuttings are returned to the surface at intervals (generally not more than 0.5 m) and are disturbed but usually unchanged in moisture content. Identification of soil strata is generally much more reliable than with continuous spiral flight augers, and is usually supplemented by occasional undisturbed tube samples.

### **Continuous Spiral Flight Augers**

The borehole is advanced using 90-115 mm diameter continuous spiral flight augers which are withdrawn at intervals to allow sampling or in-situ testing. This is a relatively economical means of drilling in clays and sands above the water table. Samples are returned to the surface, or may be collected after withdrawal of the auger flights, but they are disturbed and may be mixed with soils from the sides of the hole. Information from the drilling (as distinct from specific sampling by SPTs or undisturbed samples) is of relatively low reliability, due to the remoulding, possible mixing or softening of samples by groundwater.

### **Non-core Rotary Drilling**

The borehole is advanced using a rotary bit, with water or drilling mud being pumped down the drill rods and returned up the annulus, carrying the drill cuttings. Only major changes in stratification can be determined from the cuttings, together with some information from the rate of penetration. Where drilling mud is used this can mask the cuttings and reliable identification is only possible from separate sampling such as SPTs.

### **Continuous Core Drilling**

A continuous core sample can be obtained using a diamond tipped core barrel, usually with a 50 mm internal diameter. Provided full core recovery is achieved (which is not always possible in weak rocks and granular soils), this technique provides a very reliable method of investigation.

### **Standard Penetration Tests**

Standard penetration tests (SPT) are used as a means of estimating the density or strength of soils and also of obtaining a relatively undisturbed sample. The test procedure is described in Australian Standard 1289, Methods of Testing Soils for Engineering Purposes - Test 6.3.1.

The test is carried out in a borehole by driving a 50 mm diameter split sample tube under the impact of a 63 kg hammer with a free fall of 760 mm. It is normal for the tube to be driven in three successive 150 mm increments and the 'N' value is taken as the number of blows for the last 300 mm. In dense sands, very hard clays or weak rock, the full 450 mm penetration may not be practicable and the test is discontinued.

The test results are reported in the following form.

 In the case where full penetration is obtained with successive blow counts for each 150 mm of, say, 4, 6 and 7 as:

#### 4,6,7 N=13

In the case where the test is discontinued before the full penetration depth, say after 15 blows for the first 150 mm and 30 blows for the next 40 mm as:

15, 30/40 mm

# Sampling Methods

The results of the SPT tests can be related empirically to the engineering properties of the soils.

### Dynamic Cone Penetrometer Tests / Perth Sand Penetrometer Tests

Dynamic penetrometer tests (DCP or PSP) are carried out by driving a steel rod into the ground using a standard weight of hammer falling a specified distance. As the rod penetrates the soil the number of blows required to penetrate each successive 150 mm depth are recorded. Normally there is a depth limitation of 1.2 m, but this may be extended in certain conditions by the use of extension rods. Two types of penetrometer are commonly used.

- Perth sand penetrometer a 16 mm diameter flat ended rod is driven using a 9 kg hammer dropping 600 mm (AS 1289, Test 6.3.3). This test was developed for testing the density of sands and is mainly used in granular soils and filling.
- Cone penetrometer a 16 mm diameter rod with a 20 mm diameter cone end is driven using a 9 kg hammer dropping 510 mm (AS 1289, Test 6.3.2). This test was developed initially for pavement subgrade investigations, and correlations of the test results with California Bearing Ratio have been published by various road authorities.

# Soil Descriptions

### **Description and Classification Methods**

The methods of description and classification of soils and rocks used in this report are generally based on Australian Standard AS1726:2017, Geotechnical Site Investigations. In general, the descriptions include strength or density, colour, structure, soil or rock type and inclusions.

5

### Soil Types

Soil types are described according to the predominant particle size, qualified by the grading of other particles present:

Туре	Particle size (mm)
Boulder	>200
Cobble	63 - 200
Gravel	2.36 - 63
Sand	0.075 - 2.36
Silt	0.002 - 0.075
Clay	<0.002

The sand and gravel sizes can be further subdivided as follows:

Туре	Particle size (mm)
Coarse gravel	19 - 63
Medium gravel	6.7 - 19
Fine gravel	2.36 - 6.7
Coarse sand	0.6 - 2.36
Medium sand	0.21 - 0.6
Fine sand	0.075 - 0.21

Definitions of grading terms used are:

- Well graded a good representation of all particle sizes
- Poorly graded an excess or deficiency of particular sizes within the specified range
- Uniformly graded an excess of a particular particle size
- Gap graded a deficiency of a particular particle size with the range

The proportions of secondary constituents of soils are described as follows:

In fine grained soils (	>35% fines)	)
-------------------------	-------------	---

Term	Proportion	Example			
	of sand or				
	gravel				
And	Specify	Clay (60%) and			
		Sand (40%)			
Adjective	>30%	Sandy Clay			
With	15 – 30%	Clay with sand			
Trace	0 - 15%	Clay with trace			
		sand			

### In coarse grained soils (>65% coarse)

<ul> <li>with clays or silts</li> </ul>	6	
Term	Proportion of fines	Example
And	Specify	Sand (70%) and Clay (30%)
Adjective	>12%	Clayey Sand
With	5 - 12%	Sand with clay

0 - 5%

Sand with trace clay

# In coarse grained soils (>65% coarse) - with coarser fraction

Trace

Term	Proportion	Example	
	of coarser		
	fraction		
And	Specify	Sand (60%) and	
		Gravel (40%)	
Adjective	>30%	Gravelly Sand	
With	15 - 30%	Sand with gravel	
Trace	0 - 15%	Sand with trace	
		gravel	

The presence of cobbles and boulders shall be specifically noted by beginning the description with 'Mix of Soil and Cobbles/Boulders' with the word order indicating the dominant first and the proportion of cobbles and boulders described together.

# Soil Descriptions

### **Cohesive Soils**

Cohesive soils, such as clays, are classified on the basis of undrained shear strength. The strength may be measured by laboratory testing, or estimated by field tests or engineering examination. The strength terms are defined as follows:

Description	Abbreviation	Undrained shear strength (kPa)
Very soft	VS	<12
Soft	S	12 - 25
Firm	F	25 - 50
Stiff	St	50 - 100
Very stiff	VSt	100 - 200
Hard	Н	>200
Friable	Fr	-

### **Cohesionless Soils**

Cohesionless soils, such as clean sands, are classified on the basis of relative density, generally from the results of standard penetration tests (SPT), cone penetration tests (CPT) or dynamic penetrometers (PSP). The relative density terms are given below:

Relative Density	Abbreviation	Density Index (%)
Very loose	VL	<15
Loose	L	15-35
Medium dense	ense MD	35-65
Dense	D	65-85
Very dense	VD	>85

### Soil Origin

It is often difficult to accurately determine the origin of a soil. Soils can generally be classified as:

- Residual soil derived from in-situ weathering of the underlying rock;
- Extremely weathered material formed from in-situ weathering of geological formations. Has soil strength but retains the structure or fabric of the parent rock;
- Alluvial soil deposited by streams and rivers;

- Estuarine soil deposited in coastal estuaries;
- Marine soil deposited in a marine environment;
- Lacustrine soil deposited in freshwater lakes;
- Aeolian soil carried and deposited by wind;
- Colluvial soil soil and rock debris transported down slopes by gravity;
- Topsoil mantle of surface soil, often with high levels of organic material.
- Fill any material which has been moved by man.

**Moisture Condition – Coarse Grained Soils** For coarse grained soils the moisture condition

should be described by appearance and feel using the following terms:

- Dry (D) Non-cohesive and free-running.
- Moist (M) Soil feels cool, darkened in colour.

Soil tends to stick together. Sand forms weak ball but breaks easily.

Wet (W) Soil feels cool, darkened in colour.

Soil tends to stick together, free water forms when handling.

### **Moisture Condition – Fine Grained Soils**

For fine grained soils the assessment of moisture content is relative to their plastic limit or liquid limit, as follows:

- 'Moist, dry of plastic limit' or 'w <PL' (i.e. hard and friable or powdery).
- 'Moist, near plastic limit' or 'w ≈ PL (i.e. soil can be moulded at moisture content approximately equal to the plastic limit).
- 'Moist, wet of plastic limit' or 'w >PL' (i.e. soils usually weakened and free water forms on the hands when handling).
- 'Wet' or 'w ≈LL' (i.e. near the liquid limit).
- 'Wet' or 'w >LL' (i.e. wet of the liquid limit).

# Symbols & Abbreviations

#### Introduction

These notes summarise abbreviations commonly used on borehole logs and test pit reports.

#### **Drilling or Excavation Methods**

С	Core drilling
R	Rotary drilling
SFA	Spiral flight augers
NMLC	Diamond core - 52 mm dia
NQ	Diamond core - 47 mm dia
HQ	Diamond core - 63 mm dia
PQ	Diamond core - 81 mm dia

#### Water

$\triangleright$	Water seep
$\bigtriangledown$	Water level

### Sampling and Testing

- A Auger sample
- B Bulk sample
- D Disturbed sample
- E Environmental sample
- U<sub>50</sub> Undisturbed tube sample (50mm)
- W Water sample
- pp Pocket penetrometer (kPa)
- PID Photo ionisation detector
- PL Point load strength Is(50) MPa
- S Standard Penetration Test
- V Shear vane (kPa)

### **Description of Defects in Rock**

The abbreviated descriptions of the defects should be in the following order: Depth, Type, Orientation, Coating, Shape, Roughness and Other. Drilling and handling breaks are not usually included on the logs.

#### **Defect Type**

Bedding plane
Clay seam
Cleavage
Crushed zone
Decomposed seam
Fault
Joint
Lamination
Parting
Sheared Zone
Vein

#### Orientation

The inclination of defects is always measured from the perpendicular to the core axis.

- h horizontal
- v vertical
- sh sub-horizontal

ar

sv sub-vertical

### Coating or Infilling Term

cln	clean
со	coating
he	healed
inf	infilled
stn	stained
ti	tight
vn	veneer

#### **Coating Descriptor**

ca	calcite
cbs	carbonaceous
cly	clay
fe	iron oxide
mn	manganese
slt	silty

#### Shape

cu	curved
ir	irregular
pl	planar
st	stepped
un	undulating

#### Roughness

ро	polished
ro	rough
sl	slickensided
sm	smooth
vr	very rough

#### Other

fg	fragmented
bnd	band
qtz	quartz

Quality Contro	Quality Control Definitions						
Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.						
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.						
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.						
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.						
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which						

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

are similar to the analyte of interest, however are not expected to be found in real samples.

The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

#### Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

## 1 INTRODUCTION

ACOR Consultants have been engaged by Office Deicke to prepare an On-site and Soil Evaluation (OSE) for the purposes of effluent disposal on an unsewered property at 1299 Mossman-Daintree Road, Rocky Point.

This OSE addresses management of disposal of effluent generated from the domestic waste stream from three (3) individual residences located on three (3) separate but adjoining allotments in accordance with the "Queensland Plumbing and Wastewater Code" and AS/NZS 1547:2012 "On-site domestic-wastewater management".

## 2 PROPOSED DEVELOPMENT

The project comprises construction of three (3) individual residences located on three (3) separate but adjoining allotments Lot 2, Lot 3 and Lot 4 of the subdivided property at 1299 Mossman Daintree Road. Each residence to be two storey and constructed on the existing building platforms provisioned when the property was subdivided.

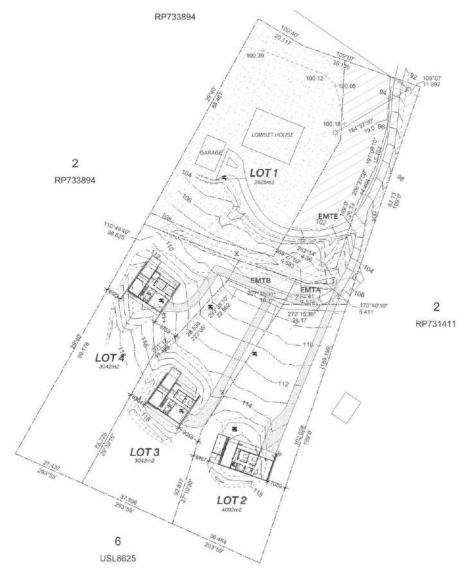

Figure 2.1 – Proposed Site Locality

## **3 SITE INVESTIGATION**

A site and soil investigation was undertaken on 4 May 2022 by Douglas and Partners. The investigation included the excavation of ten test pits and laboratory testing of selected samples. The details of the field and laboratory work are presented in Appendix B – Geotechnical Report.

The investigation assessed the subsurface soil and groundwater conditions to provide:

- site classification to AS 2870 (2011)
- allocation of soil categories and determination of design soil permeability and design effluent loading rates based on AS 1547 (2012)

#### 3.1 Location & Site Description

 Street Address
 1299A, 1299B and 1299C Mossman-Daintree Road, Rocky Point QLD 4874.

 Site Area
 Lot 2 3745m2

 Lot 3 3309m2
 Lot 4 3042m2

 Local Authority
 Douglas Shire Council

 Existing Land Use
 Vacant (part of a recently completed subdivision)

#### 3.2 Topography & Features

A site survey is presented in Appendix A – Site Survey Plan, including contours and levels over the site.

The site comprises three adjoining allotments within a battle-axe area above an existing residence (refer Appendix A - Site Survey Plan). Each individual lot is approximately rectangular in shape.

The entire site (3 lots) is situated on the north-eastern facing foot slopes of the Dagmar Range and site elevations approximately range from 35 AHD to 55 AHD.

The southwestern portion of the site (approximately 25%) comprises steeply sloping hillside vegetated by dense rainforest. Previous earthworks have been undertaken to prepare a building platform at each of the three allotments using localised cut and filling. The natural slope gradients downhill from each building platform at a range of between 10° to 15°.

An open unlined drain has been excavated along much of the site's eastern boundary along the driveway, presumably to divert overland flows down to the road reserve.

Deeply eroded ephemeral water courses / surface drains were observed to the east and north of site indicating the likelihood of significant overland flows during and following significant rainfall events.

The site is bordered by residential properties downhill to the north, to the east and to the west, and steeply sloping, densely vegetated slopes uphill to the south.

#### 3.3 Vegetation

The southwestern portion of the site (approximately 25%) comprises steeply sloping hillside vegetated by dense rainforest.

The main portion of the site, below the south-western steep slopes, has been cleared of native vegetation and is generally vegetated by short grass with several large trees and shrubs around the building platforms.

#### 3.4 Soils

Subsurface conditions may be grouped into two areas for discussion, the Modified Areas or building platforms and the Natural Areas downslope of the building platforms.

- Modified Areas: Fill comprising medium dense clayey sandy gravel was encountered to depths of between 1.2 m and 2.2 m at the building platforms. Natural materials encountered within the building platform test locations are broadly characterised by colluvial clayey or silty sandy gravel with cobbles (generally assessed to be medium dense or denser).
- Natural Areas: The downslope hillside test locations generally comprised a shallow (0.15 m or 0.2 m thick) layer of firm or stronger clayey silt topsoil overlying stiff or stronger clayey silt.

The Geotechnical Report states that the controlling soil for on-site effluent disposal by traditional systems is likely to be the residual clayey silt due to its low permeability and poor soil structure. Based on Table 5.1 of (AS 1547, 2012), for a weakly structured Category 4 soil an indicative permeability of between 0.12 and 0.5 m/day is suggested.

Free groundwater was not observed in any of the test pits.

## 4 WASTEWATER SOURCES AND QUANTITY

Wastewater generated from the proposed development is anticipated to be of a domestic nature only. Tradewaste discharge (such as oils, paints, etc) is not expected to be generated from any residence. The owners are to consult with the manufacturer of the wastewater treatment plant to ensure that any waste disposed of to the sewer system is capable of being treated by the plant.

Domestic wastewater flow design allowances for each proposed residence are presented below table in accordance with AS:1547 (2012) Table H1 and equivalent Queensland Plumbing and Wastewater Code Table T2.

 Table 4.1 – Domestic Wastewater Flow Design Allowance

Source	Number of Persons	Total Flow (I/person/day)
3 Bedroom Residence	4	600

## 5 WASTEWATER TREATMENT AND DISPOSAL

#### 5.1 Site Factors

The following factors are identified as those that will govern the level of effluent treatment and the land application system type (Absorption Beds and Trenches, Evapotranspiration Area, Mounds, Subsoil Drip Irrigation and Surface Irrigation).

#### 5.1.1 Soil Category

The soil category for this site is category 4 and comprised a shallow layer of firm clayey topsoil with low permeability. Mounds are suitable for this application.

#### 5.1.2 Setback distances

A 10m offset distance is required from the intermittent water course found on the site provided advanced secondary treatment sewage plant is used. This distance increases for sewage treatment plants that discharge a lower quality effluent.

#### 5.1.3 Vegetation

The main portion of the site, below the south-western steep slopes, has mostly been cleared of native vegetation and is generally vegetated by short grass with several large trees and shrubs around the building platforms. There are significant large trees that will cast shadow over the available areas for effluent application.

#### 5.1.4 Slope gradient

Most of the proposed effluent disposal area is moderately sloped at 10-15%. Although Subsoil Drip Irrigation is most suitable for this application (up to 30°), Mounds are also suitable up to 15°.

#### 5.1.5 Land availability

Due to the steep slope and vegetation at the rear of the sites the land available for land application will be limited. This is further limited by the siting of the building pad for Lot 4. Mound beds with a smaller footprint will be the preferred option for effluent disposal.

#### 5.1.6 Climate factors

The site is in a wet climate. Mounds are preferred in this instance.

#### 5.2 **Proposed Pre-Treatment**

Water reduction facilities are recommended to be installed to all fixtures discharging to the wastewater treatment plant. Note that water reduction facilities will be required under Queensland Development Code MP4.1 – Sustainable Buildings and include installation of 3 star WELS water saving shower roses, 4 Star WELS dual flush (3/4.5 litre) flush toilets, and 3 Star WELS tapware to all other fixtures at minimum. The owners can elect to use further reduction facilities such as front load washing machines, higher WELS rated tapware, and aerator faucets to further reduce hydraulic loading.

### 5.3 **Proposed Treatment**

# To ensure that horizontal separation distances are minimised, and the land application area can adequately fit on the site, it is proposed to utilise a proprietary treatment plant capable of achieving effluent to an advanced secondary standard.

The owners are to ensure the treatment plant selected is approved by the Local Authority and has Chief Executive Approval under the Queensland Plumbing and Wastewater Code.

A maintenance agreement between the property owners and the manufacturer of the treatment plant, or authorized service agent, is to be entered into to ensure the continued proper operation of the treatment plant and that it complies with the secondary effluent compliance criteria in accordance with the Queensland Plumbing and Wastewater Code Appendix 1 (and below).

Parameter	Level
Biochemical Oxygen Demand (BOD₅)	90% of samples taken over test period must have a BOD <sub>5</sub> less than 10g/m <sup>3</sup> with no sample greater than 20g/m <sup>3</sup>
Total Suspended Solids (TSS)	90% of samples taken over test period must have a BOD <sub>5</sub> less than 30g/m <sup>3</sup> with no sample greater than 20g/m <sup>3</sup>
Thermotolerant Coliform (org/100mL)	90% of samples taken over test period must have a thermotolerant coliform count not exceeding 10 organisms per 100mL with no sample exceeding 200 organisms per 100mL.
Chlorination	Where chlorination is used the total chlorination must be greater than or equal to 0.5g/m <sup>3</sup> and less than 2.0g/m <sup>3</sup> in four

Table 5.1 – Advanced Secondary Effluent Compliance Criteria

out of five sample taken.

#### 5.4 **Proposed Land Application Area**

Mounds are proposed to be provided for disbursement of the (treated) advanced secondary effluent. The northern portion of each site has been adopted as the location of the land application area.

The required irrigation area is 171m2 which has been calculated from recommended design irrigation rates in Table 4.2A4 of AS/NZS 1547:2012. Refer to Appendix F for calculations and assumptions. A reserve area of 171m2, representing 100% of the design area, can be accommodated on the site and is to be used for resting of the land-application system, if required, or for duplication of the land application system due to unforeseen circumstances.

The area set aside for subsurface irrigation shall be prepared in accordance with AS/NZS 1547:2012 Appendix M Refer to Appendix B for a copy of the Effluent Disposal Plan, which provides a layout and details of the effluent disposal areas to ensure compliance with AS/NZS 1547:2012. There are proposed to be two irrigation zones for each allotment where an automatic distribution valve alternates irrigation between these areas. This allows for drying out of each area between irrigation events, rather than having a constantly wet area that gets dosed every irrigation event.

The irrigation area shall be planted to ensure the uptake of nutrients and to promote evapotranspiration. Australian natives are typically adversely affected if exposed to regular periods of effluent irrigation and a local nursery should be consulted for types and species of plants suitable for the land application area. The owner is to ensure that any trees planted near the irrigation areas do not cast excessive shade of the irrigation area when mature.

Diversion drains and/or cut off drains are to be installed upslope of all irrigation areas to direct stormwater runoff around the irrigation area. This will also aid in delineating the land application area. Warning signs complying with AS/NZS:1319 at the boundaries of the irrigation area, in at least two places, clearly visible to the occupants with wording such as "Recycled Water – Avoid Contact – DO NOT DRINK" are to be installed.

#### 5.5 Separation Distances

The subsurface land application area shall have minimum separation distances as specified in Table T4 and T7 of the Queensland Plumbing and Wastewater Code. Refer to Table 5.2 and Table 5.3 below which reproduces these required separation distances.

Feature	Horizontal Separation Distance (metres)		
	Up slope	Down slope	Level
Property boundaries, pedestrian paths, walkways, recreation areas, retaining wall, and footings for buildings and other structures.	2	4	2
Inground swimming pools	6	6	6
Inground potable water tank not exposed to primary effluent	6	6	6

Table 5.2 – Setback Distances for Subsurface Land Application Area

Inground potable water tank exposed to primary effluent	15	15	15
---	----	----	----

(Ref: Table T4 Queensland Plumbing and Wastewater Code)

## Table 5.3 – Setback Distances for On-site Sewerage Facilities – Protection of Surface Water and Groundwater

Feature	Horizontal Separation Distance (metres)
	Advanced Secondary
Top of bank of permanent water course	10
Top of bank of intermittent water course	
Top of bank of a lake, bay or estuary	
Top water level of a surface water source used for agriculture, aquaculture or stock purposes	
Open stormwater drainage channel or drain	
Bore or a dam	
Unsaturated soil depth to a permanent water table (vertically)	0.3

(Ref: Table T7 Queensland Plumbing and Wastewater Code)

Refer to Appendix B for a copy of the Effluent Disposal Plan, which provide separation distances on the site plan to ensure compliance with the Queensland Plumbing and Wastewater Code.

## **6 OPERATION AND MAINTENANCE**

It is the responsibility of the property owner to ensure the effluent generated does not cause nuisance via seepage, runoff, drift, or spray to adjoin properties or water courses

The property owner is responsible for the operation and maintenance of the installation. This includes engaging an authorized service agent to maintain the facility at appropriate service intervals.

The wastewater treatment plant is to be installed and operated in accordance with the manufacturer's specifications, instructions, and recommendations.

The surface irrigated land application area shall be maintained by the property owner to ensure maximum uptake of nutrients and evapotranspiration. This will include mowing of grassed areas, pruning of all plants as required, weeding and replacement of dead plants as required.

Irrigation of food crops with secondary treated effluent shall not occur.

## 7 CONCLUSION

Based on the architectural plans presented in Appendix D, the wastewater generated from the proposed 3x residences will be capable of being disposed of on-site in a safe manner in accordance with the Queensland Plumbing and Wastewater Code and AS:1547 (2012).

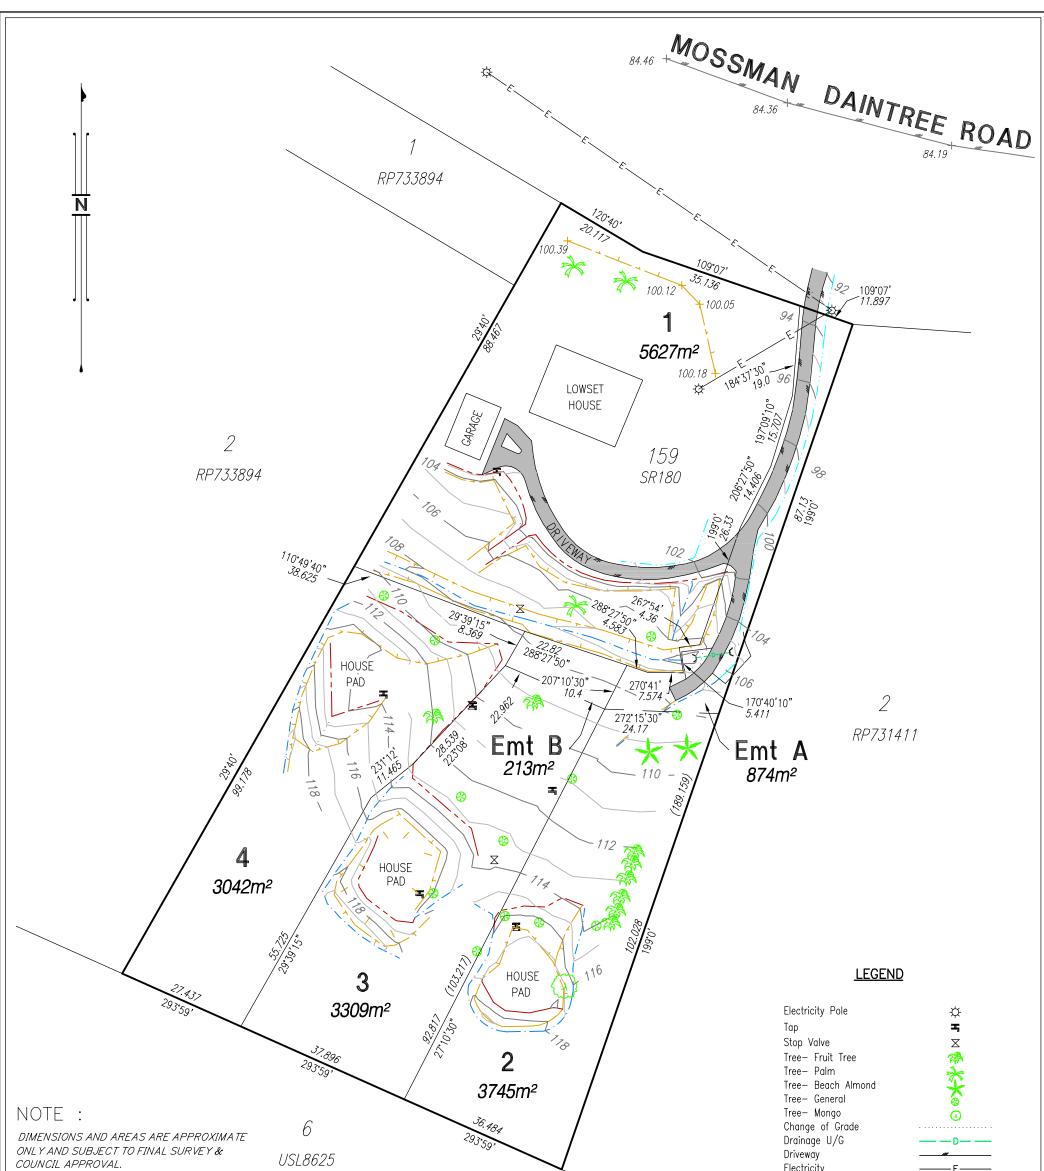

An Effluent Disposal Plan has been prepared and presented in Appendix C to ensure compliance.

If the land application system is not located in accordance with these plans, or if any alterations are made to the Architectural plans presented in Appendix D, or any other alterations occur that may alter the effectiveness of the management of land application system, then ACOR Consultants are to be notified so appropriate advice and suitable amendments to the design and documentation can be completed and resubmitted to the local authority if required.

## Report on Geotechnical Investigation Proposed Residences Mossman Daintree Road, Rocky Point

## 1. Introduction

This report presents the results of geotechnical investigation undertaken by Douglas Partners Pty Ltd (DP) for three proposed residential dwellings at Mossman Daintree Road, Rocky Point. The investigation was commissioned in an email dated 28 April 2022 by Mr John Deicke of Office Deicke and was undertaken in accordance with DP proposal 214803.00.P.001.Rev0 dated 23 April 2022.

It is understood that the project includes the construction of three residential dwellings on separate but adjoining allotments of the subdivided 1299 Mossman Daintree Road.

The aim of the investigation was to assess the subsurface soil and groundwater conditions at the field test locations to provide:

- site classification to AS 2870 (2011);
- excavation conditions and suitable temporary and permanent batter slopes;
- site preparation earthworks and suitability of site won materials for re-use as engineered fill;
- geotechnical retaining wall design parameters;
- footing options and footing design parameters; and
- allocation of soil categories and determination of design soil permeability and design effluent loading rates based on AS 1547 (2012).

Slope risk assessment was excluded from the requested scope of work.

The investigation included the excavation of ten test pits and laboratory testing of selected samples. The details of the field and laboratory work are presented in this report, together with comments and recommendations on the items listed above.

This report must be read in conjunction with the notes entitled 'About This Report' in Appendix A and other explanatory notes, and should be kept in its entirety without separation of individual pages or sections.

### 2. Proposed Development

DP was supplied with a preliminary site plan (Drawing SD\_A01\_0101 dated 4 February 2022) for the purposes of investigation planning which is included in Appendix B for ease of reference. This plan indicated the proposed development to comprise the construction of three, two-level residential dwellings on the existing building platforms. It is assumed the buildings will be constructed using lightweight materials, elevated above ground and supported by steel posts.

## 3. Site Description

The site (designated as 1299A to 1299C Mossman Daintree Road) comprises three adjoining allotments within a battle-axe area above an existing residence (refer Drawing 1 in Appendix B and Figure 1 below). Each lot is approximately rectangular in shape, and comprising an area of  $3042 \text{ m}^2$  (Lots 3 and 4) or  $4092 \text{ m}^2$  (Lot 2). For the purposes of this report, 'site' refers to the combined area of the three allotments.

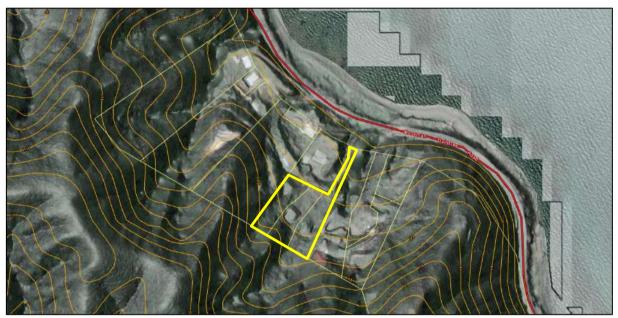

Figure 1: Qld Globe image showing site location in yellow outline.

The site is situated on the north-eastern facing foot slopes of the Dagmar Range and site elevations approximately range from 35 AHD to 55 AHD. Much of the southwestern portion of the site (approximately 25%) comprises steeply sloping hillside vegetated by dense rainforest.

Previous earthworks are evident on site including the preparation of building platforms using 'cut to fill' methodology, and an open unlined drain has been excavated along much of the site's eastern boundary, presumably to divert overland flows down to the road reserve. No structures were observed within site boundaries and other than that for the above earthworks, it appears that no previous site development has occurred.

The main portion of the site, below the south-western steep slopes, has mostly been cleared of native vegetation and is generally vegetated by short grass with several large trees and shrubs present mostly around the building platforms (refer Figures 2 to 5). The terrain in the cleared portions is generally uneven and hummocky, and the building platforms appear to have been created by localised cutting and filling. The natural slope gradients downhill of the of the building platforms generally range between 10° to 15°(ie 'moderately' sloping).

The site is bordered by residential properties downhill to the north, east and west, and steeply sloping, densely vegetated slopes uphill to the south.

Figure 2: Showing general site conditions. Photo is from the end of the shared driveway with a view towards the southwest.

Figure 3: View looking northeast showing the building platform at 1299A.

Figure 4: View looking northeast showing the building platform at 1299B.

Figure 5: View looking west showing the building platform at 1299C.

### 4. Geology

Reference to the Mossman 1:100,000 Geological Series Sheet (Department of Mines and Energy, 1999) indicates that the site is underlain by Hodgkinson Formation bedrock typically comprising siltstone and fine to coarse grained arenite, and residual soils thereof.

Investigation findings are generally consistent with the published findings however colluvial materials were commonly encountered, generally overlying residual soils in the majority of the test locations.

#### 5. Field Work

#### 5.1 Methods

The field work was completed on 4 May 2022 and comprised the excavation of ten test pits, designated as Pits 1 to 10, to depths ranging from 1.7 m to 3.9 m. Approximate test locations are shown on Drawing 1 in Appendix B.

The pits were excavated using a 5.5 tonne excavator. Strata identification was through observation of excavated spoil, and soil samples were taken at regular depth intervals for laboratory testing. Pocket penetrometer readings were taken in the walls of the pits and dynamic cone penetrometer (DCP) tests were undertaken alongside the pits to provide additional information for assessment of soil strength consistency. On completion of excavation, the pits were backfilled with excavated spoil in layers which were nominally compacted using the back of the excavator bucket. Any excess spoil was mounded and track rolled at the surface.

The field work was carried out in the presence of a DP engineering geologist.

A differential GPS unit was used to record UTM co-ordinates to GDA94. Surface levels were extrapolated from a supplied contour drawing. The co-ordinates and surface levels are presented on the test pit logs in Appendix D.

#### 5.2 Results

The subsurface conditions encountered in the pits are detailed on the logs in Appendix D. Notes defining the sampling methods, soil descriptions, and symbols and abbreviations used in their preparation are given in Appendix A.

Subsurface conditions may be grouped into two areas for discussion, the building platform (ie modified) areas and downslope (ie natural) areas.

Fill, comprising medium dense clayey sandy gravel (similar to the naturally occurring colluvium encountered elsewhere on site) was encountered in Pits 2, 4 and 6 to depths of between 1.2 m and 2.2 m.

Natural materials encountered within the majority of the building platform test locations, either below the fill or from the surface (refer Pits 1, 2 and 4 to 6) are broadly characterised by colluvial clayey or silty

sandy gravel with cobbles (generally assessed to be medium dense or denser), underlain in Pits 5 and 6 by stiff or stronger residual clayey silt, transitioning to weathered siltstone within which virtual excavator refusal occurred on probable very low strength or stronger rock. Colluvium was not encountered in Pit 3, which encountered hard, residual clayey silt to 1.5 m depth, overlying siltstone to virtual excavator refusal at 1.7 m depth.

Within the downslope hillside test locations (refer Pits 7 to 10), ground conditions generally comprised a shallow (0.15 m or 0.2 m thick) layer of firm or stronger clayey silt topsoil overlying stiff or stronger clayey silt. The exception to this generalised profile description was the presence of very stiff silty clay encountered below 1.5 m depth in Pit 7, to the limit of investigation.

Free groundwater was not observed in any of the test pits, however it should be noted that groundwater depths and ground moisture conditions are affected by climatic conditions, soil permeability and human influences, and will therefore vary with time. Rocky Point is in the wet tropics and subject to wet and dry seasons, during which the groundwater levels may be prone to vary considerably.

Deeply eroded ephemeral water courses / surface drains were observed to the east and north of site indicating the likelihood of significant overland flows during and following significant rainfall events.

## 6. Laboratory Testing

#### **Geotechnical Laboratory Testing** 6.1

Geotechnical laboratory testing comprised:

- Atterberg limits, linear shrinkage, and field moisture content (three tests); and
- Particle size distribution, greater than 0.075 mm (two tests).

Geotechnical laboratory results are summarised in Tables 1 and 2, with laboratory certificates presented in Appendix E.

Pit	Depth (m)	Primary Description	FMC (%)	LL (%)	PL (%)	PI (%)	LS (%)
4	0.5	Clayey Sandy GRAVEL	18.1	28	23	5	3.5
5	1.0	Clayey SILT	18.0	34	23	11	4.5
8	0.3	Clayey SILT	14.7	24	19	5	2.5
Notes to				_ '	.0	•	2.0

### Table 1: Results of Laboratory Testing – Field Moisture, Atterberg Limits and Linear Shrinkage

FMC - Field Moisture Content LL - Liquid Limit

PL - Plastic Limit

PI - Plasticity Index LS - Linear Shrinkage

Pit	Depth (m)	Primary Description	Gravel (%)	Sand (%)	Silt and clay (%)
1	0.4	Clayey Sandy GRAVEL	38	30	32
4	0.5	Clayey GRAVEL	52	19	29

## Table 2: Results of Laboratory Testing - Gradings

## 6.2 Effluent Disposal Laboratory Testing

Effluent disposal laboratory testing comprised:

- Emerson class number, soil pH, electrical conductivity (EC), cation exchange capacity (three tests); and
- total nitrogen, sodium adsorption ratio, phosphorous absorption capacity (three tests).

Effluent disposal laboratory results are summarised in Tables 3 and 4, with laboratory certificates presented in Appendix E.

Pit	Depth (m)	Primary Description	Soil pH 1:5	EC (µS/cm)	Phosphorous Sorption Capacity (mgP/kg)	Total Nitrogen in Soil (mg/kg)	Sodium Adsorption Ratio	Emerson Class Number
7	1.7	Silty CLAY	5.9	48	670	170	1.2	5
9	1.5	Clayey SILT	5.2	51	560	180	1.8	6
10	1.0	Clayey SILT	5.4	45	530	270	0.56	5

Table 3: Results of pH, EC, Phosphorous Ssorption and Emerson Class Number Testing

### Table 4: Results of Cation Exchange Capacity Testing

Pit	Depth (m)	Description	Calcium (meq%)	Potassium (meq%)	Magnesium (meq%)	Sodium (meq%)	CEC (meq%)	ESP (%)
7	1.7	Silty CLAY	0.2	<0.1	0.1	<0.1	<1	<1
9	1.5	Clayey SILT	0.1	<0.1	<0.1	<0.1	<1	<1
10	1.0	Clayey SILT	0.5	<0.1	0.2	<0.1	<1	<1

Legend:

CEC – cation exchange capacity

ESP - exchangeable sodium percentage

# 7. Comments

## 7.1 Appreciation of Site Geotechnical Conditions

The natural ground conditions at the field test locations are generally characterised as comprising medium dense or denser colluvial soils consisting of varying proportions of clayey silt, sand, gravel and cobbles, generally overlying residual stiff or stronger clayey silt transitioning with depth to weathered siltstone bedrock. Fill of similar properties to the colluvial soils was encountered to depths of between 1.2 m and 2.2 m within the north-western portions of each of the building platforms. It is assumed that the fill has been site-won from the uphill (south-western) sides of the building platform areas.

In isolation of upslope instability risk, the assessment of which was not requested by the client but is assumed to have been completed by others, the primary geohazard for this project is anticipated to be that of the existing uncontrolled fill, which should not be relied upon for structural support. The design of on-site effluent disposal systems should only be undertaken by appropriately experienced personnel familiar with the site and climatic conditions, giving particular consideration to hydraulic balance during the wet season.

Further comments on design and construction are given in the following sections of the report.

## 7.2 Site Classification

AS 2870 (2011) states that site classification is based on expected ground surface movement. Surface movement is usually due to soil reactivity under normal moisture conditions, however in some cases the level of ground movement may be controlled by other factors. Sites where ground movements may be significantly affected by factors other than reactive soil movements under normal moisture conditions are classified as 'Class P' under the standard and footing design must by based on engineering principles.

AS2870 (2011) provides a list of scenarios that would require a 'Class P' classification, including the presence of 'uncontrolled' fill, which applies to the existing building platforms in their current conditions.

## 7.3 Excavation Conditions

Excavations for high level footings and trenches for effluent disposal are anticipated to encounter either colluvial clayey/silty sandy gravel or residual clayey silt transitioning to very low strength weathered siltstone. It is considered that the colluvial and residual soils should be readily excavatable by standard small sized (ie 12 - 20 tonne) earthmoving equipment. Ripping would likely be required for excavations within low strength or stronger siltstone, depending on fracturing and strength variability.

## 7.4 Batter Slopes

Short-term temporary batter slopes of 1.5H:1V are suggested for unsurcharged, dry, temporary excavations in natural in-situ soils or existing fill up to 3 m deep. Permanent batter slope angles of no steeper than 3H:1V are suggested, with steeper slopes requiring additional geotechnical assessment, possibly requiring the construction of engineer designed retaining walls (refer Section 7.6).

Stockpiles or heavy plant should not be placed near the batter crests, as this may instigate slope failure. Further advice should be sought from DP if such surcharge is located within the batter vertical height laterally behind the crest.

Surface runoff should be diverted away from the crests and toes of the batters to reduce the potential for scour erosion. It is also recommended that all batters incorporate crest and toe drains and be appropriately vegetated with respect to erosion control.

## 7.5 Site Preparation

It is suggested that site preparation and fill for the support of ground slabs, pavements and upper level footings be carried out in accordance with the following guidelines::

- Remove all existing uncontrolled fill, surface vegetation, organic topsoil, and any deleterious soft, wet or highly compressible material;.
- Tine the subgrade and adjust the moisture content to within 2% of optimum moisture content for standard compaction (SOMC);
- Compact the subgrade with at least six passes of a minimum 12 t static weight smooth drum roller. Test roll the compacted subgrade under careful inspection by a geotechnical engineer to detect any remaining relatively soft or loose zones, which should be excavated out and replaced with approved engineered fill under 'Level 1' inspection and testing;
- If additional fill is required, place approved engineered fill in layers not exceeding 200 mm loose thickness, and compact to at least 98% standard dry density ratio or density index of at least 75%. Moisture contents within cohesive fill should be maintained within 2% of SOMC, during and after compaction; and
- Undertake 'Level 1' inspection and testing for all additional fill placement works, in accordance with AS 3798 (2007).

It is important to note that dry, over-compacted cohesive fill or cohesive subgrade (ie compacted to move than 102% SMDD and dry of OMC) is generally more prone to swelling and softening. For this reason, fill compaction and moisture should be carefully controlled on site, with both compaction and moisture control criteria included in the bulk earthworks specification.

Fill placement and compaction under 'Level 1' inspection and testing in accordance with AS 3798 (2007), is required where structural loads are to be supported by fill. A 'Level 1' inspection and test report must also be prepared at the completion of the works stating that the fill has been completed as recommended above and as required by AS 3798 (2007).

## 7.6 Retaining Walls

Table 5 presents lateral earth pressure, bulk density and sliding coefficient for the various soils encountered.

Material	Strength Consistency /Relative Density	Ka	Ко	Кр	Bulk Unit Weight (kN/m³)	tanδ⁵	
Clayey Silt / Silty Clay	Stiff	0.4	0.55	2.5	18	0.3	
	Very stiff or hard	0.4	0.55	2.5	20		
Granular	Medium dense (or denser)	0.28	0.45	3.5	20	0.4	

Notes: \* for concrete cast directly onto the clean soil surface

For design of retaining walls, due allowance should be made for the following:

- Surcharge loadings (over and above the lateral earth pressure coefficients presented above) where the finished ground level above retaining walls is above horizontal and where additional loading is likely to be applied from existing or future upslope structures, or from traffic.
- Drainage material installed for the full height behind the wall, to a width of at least 0.3 m. The material must be free draining and granular and have a perforated or slotted drainage pipe at the heel of the wall to rapidly remove the water into the stormwater system. If drainage is not provided, the wall loading caused by flooding or inundation, must be considered. Such flooding may penetrate up to 0.9 m depth into cracks behind the wall and result in a hydrostatic load.

Care should be taken when placing soils behind retaining walls, to reduce the risk of damage associated with the use of heavy compaction plant and swelling. Compaction should not exceed 95% to 98% standard maximum dry density ratio and all filling should be placed within 2% of OMC.

It is recommended that factors of safety of 2 against overturning and sliding stability and 1.5 for global stability, be adopted in the design of all retaining walls.

For limit state design methods, the ultimate parameters provided above in Table 5 will need to be factored in accordance with (AS 4678, 2002). Guidance on the selection of material strength partial factors is provided in Section 5.2 of (AS 4678, 2002) and is dependent upon the nature and state of the natural in-situ soil.

## 7.7 Footings

High level pad and strip footings up to 1 m and 0.6 m wide, respectively, founding in 'controlled' fill, medium dense or denser colluvium or stiff or stronger clayey silt may be sized for a maximum allowable bearing pressure of 100 kPa.

Settlements of approximately 10 mm to 15 mm are estimated for properly designed and constructed pad or strip footings dimensioned and supported as above. Wider footings are possible but would be subject to specific settlement assessment.

## 7.8 Soil and Site Assessment

The suitability of the site to accept effluent is dependent on a number of factors, including:

- the subsurface profile (soil and groundwater) within the proposed application area;
- the type and output nutrient quality of the treatment system utilised;
- the physical characteristics such as topography, landform, distances to water bodies, etc; and
- prevailing climatic conditions.

The controlling soil for on-site effluent disposal by traditional systems is likely to be the residual clayey silt due to its low permeability and poor soil structure. Based on Table 5.1 of (AS 1547, 2012), for a weakly structured Category 4 soil an indicative permeability of between 0.12 and 0.5 m/day is suggested.

Site and soil characteristics observed during the field work are assigned either a minor, moderate or major limitation depending on the restrictions to the disposal area in accordance with (AS 1547, 2012). The moderate/major limitations for effluent disposal within the site are shown below. Soil and site assessment summaries are provided in Appendix C.

### Cation Exchange Capacity (CEC)

The CEC results of <1 meq% fall into the major limitation category due to the inability of these soils to hold plant nutrients.

#### Soil pH

Soil pH test results of 5.2 and 5.4 fall into the moderate limitation category due to non-optimal plant growth conditions.

#### Slope Angle

Slope angle of between 10° and 20° (approximately 20% to 40% grade) is a major limiting factor for all disposal systems due to the risk of runoff.

#### Landform and Site Drainage

The site topography presents a moderate risk of groundwater pollution and transport of waste offsite.

#### Upslope seepage

The run on and upslope seepage potential is a moderate risk due to transport of wastewater off site.

## 7.9 Design Effluent Loading Rates

For Category 4 soil it is recommended that the effluent design loading rates and design irrigation rates (DLR/DIR) as presented below in Table 6 be adopted, based on (AS 1547, 2012).

Table 6: Effluent Design Loading / Irrigation Rates

Dispessel System	Effluent Design Loading / Irrigation Rates			
Disposal System	Primary Treated Effluent	Secondary Treated Effluent		
Conventional Trenches or Beds	6 to 10 mm/day	20 mm/day		
Evapotranspiration/absorption (ETA/ETS) system	8 mm/day			
Irrigation System – Drip or spray	3.5 mm/day <sup>A</sup>			
Irrigation System – Low pressure effluent distribution (LPED)	3 mm/day			
Mound System	8 mm/day			

Notes: A requires a minimum of 150 mm of high-quality topsoil

## 8. Limitations

Douglas Partners Pty Ltd (DP) has prepared this report for this project at 1299 Mossman Daintree Road in accordance with DP's proposal dated 23 April 2022 and acceptance received from John Deicke dated 28 April 2022. The work was carried out under DP's Conditions of Engagement. This report is provided for the exclusive use of Office Deicke for this project only and for the purposes as described in the report. It should not be used by or relied upon for other projects or purposes on the same or other site or by a third party. Any party so relying upon this report beyond its exclusive use and purpose as stated above, and without the express written consent of DP, does so entirely at its own risk and without recourse to DP for any loss or damage. In preparing this report DP has necessarily relied upon information provided by the client and/or their agents.

The results provided in the report are indicative of the sub-surface conditions on the site only at the specific sampling and/or testing locations, and then only to the depths investigated and at the time the work was carried out. Sub-surface conditions can change abruptly due to variable geological processes and also as a result of human influences. Such changes may occur after DP's field testing has been completed.

DP's advice is based upon the conditions encountered during this investigation. The accuracy of the advice provided by DP in this report may be affected by undetected variations in ground conditions across the site between and beyond the sampling and/or testing locations.

The assessment of atypical safety hazards arising from this advice is restricted to the geotechnical components set out in this report and based on known project conditions and stated design advice and assumptions. While some recommendations for safe controls may be provided, detailed 'safety in design' assessment is outside the current scope of this report and requires additional project data and assessment.

This report must be read in conjunction with all of the attached and should be kept in its entirety without separation of individual pages or sections. DP cannot be held responsible for interpretations or conclusions made by others unless they are supported by an expressed statement, interpretation, outcome or conclusion stated in this report.

This report, or sections from this report, should not be used as part of a specification for a project, without review and agreement by DP. This is because this report has been written as advice and opinion rather than instructions for construction.

The scope of work for this investigation/report did not include the assessment of surface or sub-surface materials or groundwater for contaminants, within or adjacent to the site. Should evidence of fill of unknown origin be noted in the report, and in particular the presence of building demolition materials, it should be recognised that there may be some risk that such fill may contain contaminants and hazardous building materials.

## **Douglas Partners Pty Ltd**

# Appendix A

About This Report

#### Introduction

These notes have been provided to amplify DP's report in regard to classification methods, field procedures and the comments section. Not all are necessarily relevant to all reports.

DP's reports are based on information gained from limited subsurface excavations and sampling, supplemented by knowledge of local geology and experience. For this reason, they must be regarded as interpretive rather than factual documents, limited to some extent by the scope of information on which they rely.

#### Copyright

This report is the property of Douglas Partners Pty Ltd. The report may only be used for the purpose for which it was commissioned and in accordance with the Conditions of Engagement for the commission supplied at the time of proposal. Unauthorised use of this report in any form whatsoever is prohibited.

#### **Borehole and Test Pit Logs**

The borehole and test pit logs presented in this report are an engineering and/or geological interpretation of the subsurface conditions, and their reliability will depend to some extent on frequency of sampling and the method of drilling or excavation. Ideally, continuous undisturbed sampling or core drilling will provide the most reliable assessment, but this is not always practicable or possible to justify on economic grounds. In any case the boreholes and test pits represent only a very small sample of the total subsurface profile.

Interpretation of the information and its application to design and construction should therefore take into account the spacing of boreholes or pits, the frequency of sampling, and the possibility of other than 'straight line' variations between the test locations.

#### Groundwater

Where groundwater levels are measured in boreholes there are several potential problems, namely:

 In low permeability soils groundwater may enter the hole very slowly or perhaps not at all during the time the hole is left open;

- A localised, perched water table may lead to an erroneous indication of the true water table;
- Water table levels will vary from time to time with seasons or recent weather changes. They may not be the same at the time of construction as are indicated in the report; and
- The use of water or mud as a drilling fluid will mask any groundwater inflow. Water has to be blown out of the hole and drilling mud must first be washed out of the hole if water measurements are to be made.

More reliable measurements can be made by installing standpipes which are read at intervals over several days, or perhaps weeks for low permeability soils. Piezometers, sealed in a particular stratum, may be advisable in low permeability soils or where there may be interference from a perched water table.

#### Reports

The report has been prepared by qualified personnel, is based on the information obtained from field and laboratory testing, and has been undertaken to current engineering standards of interpretation and analysis. Where the report has been prepared for a specific design proposal, the information and interpretation may not be relevant if the design proposal is changed. If this happens, DP will be pleased to review the report and the sufficiency of the investigation work.

Every care is taken with the report as it relates to interpretation of subsurface conditions, discussion of geotechnical and environmental aspects, and recommendations or suggestions for design and construction. However, DP cannot always anticipate or assume responsibility for:

- Unexpected variations in ground conditions. The potential for this will depend partly on borehole or pit spacing and sampling frequency;
- Changes in policy or interpretations of policy by statutory authorities; or
- The actions of contractors responding to commercial pressures.

If these occur, DP will be pleased to assist with investigations or advice to resolve the matter.

# About this Report

#### **Site Anomalies**

In the event that conditions encountered on site during construction appear to vary from those which were expected from the information contained in the report, DP requests that it be immediately notified. Most problems are much more readily resolved when conditions are exposed rather than at some later stage, well after the event.

#### Information for Contractual Purposes

Where information obtained from this report is provided for tendering purposes, it is recommended that all information, including the written report and discussion, be made available. In circumstances where the discussion or comments section is not relevant to the contractual situation, it may be appropriate to prepare a specially edited document. DP would be pleased to assist in this regard and/or to make additional report copies available for contract purposes at a nominal charge.

#### **Site Inspection**

The company will always be pleased to provide engineering inspection services for geotechnical and environmental aspects of work to which this report is related. This could range from a site visit to confirm that conditions exposed are as expected, to full time engineering presence on site.

#### Sampling

Sampling is carried out during drilling or test pitting to allow engineering examination (and laboratory testing where required) of the soil or rock.

Disturbed samples taken during drilling provide information on colour, type, inclusions and, depending upon the degree of disturbance, some information on strength and structure.

Undisturbed samples are taken by pushing a thinwalled sample tube into the soil and withdrawing it to obtain a sample of the soil in a relatively undisturbed state. Such samples yield information on structure and strength, and are necessary for laboratory determination of shear strength and compressibility. Undisturbed sampling is generally effective only in cohesive soils.

#### **Test Pits**

Test pits are usually excavated with a backhoe or an excavator, allowing close examination of the insitu soil if it is safe to enter into the pit. The depth of excavation is limited to about 3 m for a backhoe and up to 6 m for a large excavator. A potential disadvantage of this investigation method is the larger area of disturbance to the site.

#### Large Diameter Augers

Boreholes can be drilled using a rotating plate or short spiral auger, generally 300 mm or larger in diameter commonly mounted on a standard piling rig. The cuttings are returned to the surface at intervals (generally not more than 0.5 m) and are disturbed but usually unchanged in moisture content. Identification of soil strata is generally much more reliable than with continuous spiral flight augers, and is usually supplemented by occasional undisturbed tube samples.

### **Continuous Spiral Flight Augers**

The borehole is advanced using 90-115 mm diameter continuous spiral flight augers which are withdrawn at intervals to allow sampling or in-situ testing. This is a relatively economical means of drilling in clays and sands above the water table. Samples are returned to the surface, or may be collected after withdrawal of the auger flights, but they are disturbed and may be mixed with soils from the sides of the hole. Information from the drilling (as distinct from specific sampling by SPTs or undisturbed samples) is of relatively low reliability, due to the remoulding, possible mixing or softening of samples by groundwater.

### **Non-core Rotary Drilling**

The borehole is advanced using a rotary bit, with water or drilling mud being pumped down the drill rods and returned up the annulus, carrying the drill cuttings. Only major changes in stratification can be determined from the cuttings, together with some information from the rate of penetration. Where drilling mud is used this can mask the cuttings and reliable identification is only possible from separate sampling such as SPTs.

#### **Continuous Core Drilling**

A continuous core sample can be obtained using a diamond tipped core barrel, usually with a 50 mm internal diameter. Provided full core recovery is achieved (which is not always possible in weak rocks and granular soils), this technique provides a very reliable method of investigation.

#### **Standard Penetration Tests**

Standard penetration tests (SPT) are used as a means of estimating the density or strength of soils and also of obtaining a relatively undisturbed sample. The test procedure is described in Australian Standard 1289, Methods of Testing Soils for Engineering Purposes - Test 6.3.1.

The test is carried out in a borehole by driving a 50 mm diameter split sample tube under the impact of a 63 kg hammer with a free fall of 760 mm. It is normal for the tube to be driven in three successive 150 mm increments and the 'N' value is taken as the number of blows for the last 300 mm. In dense sands, very hard clays or weak rock, the full 450 mm penetration may not be practicable and the test is discontinued.

The test results are reported in the following form.

 In the case where full penetration is obtained with successive blow counts for each 150 mm of, say, 4, 6 and 7 as:

#### 4,6,7 N=13

In the case where the test is discontinued before the full penetration depth, say after 15 blows for the first 150 mm and 30 blows for the next 40 mm as:

15, 30/40 mm

# Sampling Methods

The results of the SPT tests can be related empirically to the engineering properties of the soils.

## Dynamic Cone Penetrometer Tests / Perth Sand Penetrometer Tests

Dynamic penetrometer tests (DCP or PSP) are carried out by driving a steel rod into the ground using a standard weight of hammer falling a specified distance. As the rod penetrates the soil the number of blows required to penetrate each successive 150 mm depth are recorded. Normally there is a depth limitation of 1.2 m, but this may be extended in certain conditions by the use of extension rods. Two types of penetrometer are commonly used.

- Perth sand penetrometer a 16 mm diameter flat ended rod is driven using a 9 kg hammer dropping 600 mm (AS 1289, Test 6.3.3). This test was developed for testing the density of sands and is mainly used in granular soils and filling.
- Cone penetrometer a 16 mm diameter rod with a 20 mm diameter cone end is driven using a 9 kg hammer dropping 510 mm (AS 1289, Test 6.3.2). This test was developed initially for pavement subgrade investigations, and correlations of the test results with California Bearing Ratio have been published by various road authorities.

# Soil Descriptions

## **Description and Classification Methods**

The methods of description and classification of soils and rocks used in this report are generally based on Australian Standard AS1726:2017, Geotechnical Site Investigations. In general, the descriptions include strength or density, colour, structure, soil or rock type and inclusions.

#### Soil Types

Soil types are described according to the predominant particle size, qualified by the grading of other particles present:

Туре	Particle size (mm)
Boulder	>200
Cobble	63 - 200
Gravel	2.36 - 63
Sand	0.075 - 2.36
Silt	0.002 - 0.075
Clay	<0.002

The sand and gravel sizes can be further subdivided as follows:

Туре	Particle size (mm)
Coarse gravel	19 - 63
Medium gravel	6.7 - 19
Fine gravel	2.36 - 6.7
Coarse sand	0.6 - 2.36
Medium sand	0.21 - 0.6
Fine sand	0.075 - 0.21

Definitions of grading terms used are:

- Well graded a good representation of all particle sizes
- Poorly graded an excess or deficiency of particular sizes within the specified range
- Uniformly graded an excess of a particular particle size
- Gap graded a deficiency of a particular particle size with the range

The proportions of secondary constituents of soils are described as follows:

In fine grained soils (>	>35% fines)
--------------------------	-------------

Term	Proportion	Example			
	of sand or				
	gravel				
And	Specify	Clay (60%) and			
		Sand (40%)			
Adjective	>30%	Sandy Clay			
With	15 – 30%	Clay with sand			
Trace	0 - 15%	Clay with trace			
		sand			

## In coarse grained soils (>65% coarse)

<ul> <li>with clays or silts</li> </ul>	6	
Term	Proportion of fines	Example
And	Specify	Sand (70%) and Clay (30%)
Adjective	>12%	Clayey Sand
With	5 - 12%	Sand with clay
Trace	0 - 5%	Sand with trace

clay

In coarse grained soils (>65% coarse)
- with coarser fraction

Term	Proportion of coarser fraction	Example
And	Specify	Sand (60%) and Gravel (40%)
Adjective	>30%	Gravelly Sand
With	15 - 30%	Sand with gravel
Trace	0 - 15%	Sand with trace gravel

The presence of cobbles and boulders shall be specifically noted by beginning the description with 'Mix of Soil and Cobbles/Boulders' with the word order indicating the dominant first and the proportion of cobbles and boulders described together.

# Soil Descriptions

#### **Cohesive Soils**

Cohesive soils, such as clays, are classified on the basis of undrained shear strength. The strength may be measured by laboratory testing, or estimated by field tests or engineering examination. The strength terms are defined as follows:

Description	Abbreviation	Undrained shear strength (kPa)
Very soft	VS	<12
Soft	S	12 - 25
Firm	F	25 - 50
Stiff	St	50 - 100
Very stiff	VSt	100 - 200
Hard	Н	>200
Friable	Fr	-

#### **Cohesionless Soils**

Cohesionless soils, such as clean sands, are classified on the basis of relative density, generally from the results of standard penetration tests (SPT), cone penetration tests (CPT) or dynamic penetrometers (PSP). The relative density terms are given below:

Relative Density	Abbreviation	Density Index (%)
Very loose	VL	<15
Loose	L	15-35
Medium dense	MD	35-65
Dense	D	65-85
Very dense	VD	>85

### Soil Origin

It is often difficult to accurately determine the origin of a soil. Soils can generally be classified as:

- Residual soil derived from in-situ weathering of the underlying rock;
- Extremely weathered material formed from in-situ weathering of geological formations. Has soil strength but retains the structure or fabric of the parent rock;
- Alluvial soil deposited by streams and rivers;

- Estuarine soil deposited in coastal estuaries;
- Marine soil deposited in a marine environment;
- Lacustrine soil deposited in freshwater lakes;
- Aeolian soil carried and deposited by wind;
- Colluvial soil soil and rock debris transported down slopes by gravity;
- Topsoil mantle of surface soil, often with high levels of organic material.
- Fill any material which has been moved by man.

**Moisture Condition – Coarse Grained Soils** For coarse grained soils the moisture condition

should be described by appearance and feel using the following terms:

- Dry (D) Non-cohesive and free-running.
- Moist (M) Soil feels cool, darkened in colour.

Soil tends to stick together. Sand forms weak ball but breaks easily.

Wet (W) Soil feels cool, darkened in colour.

Soil tends to stick together, free water forms when handling.

### **Moisture Condition – Fine Grained Soils**

For fine grained soils the assessment of moisture content is relative to their plastic limit or liquid limit, as follows:

- 'Moist, dry of plastic limit' or 'w <PL' (i.e. hard and friable or powdery).
- 'Moist, near plastic limit' or 'w ≈ PL (i.e. soil can be moulded at moisture content approximately equal to the plastic limit).
- 'Moist, wet of plastic limit' or 'w >PL' (i.e. soils usually weakened and free water forms on the hands when handling).
- 'Wet' or 'w ≈LL' (i.e. near the liquid limit).
- 'Wet' or 'w >LL' (i.e. wet of the liquid limit).

# Symbols & Abbreviations

#### Introduction

These notes summarise abbreviations commonly used on borehole logs and test pit reports.

#### **Drilling or Excavation Methods**

С	Core drilling
R	Rotary drilling
SFA	Spiral flight augers
NMLC	Diamond core - 52 mm dia
NQ	Diamond core - 47 mm dia
HQ	Diamond core - 63 mm dia
PQ	Diamond core - 81 mm dia

#### Water

$\triangleright$	Water seep
$\bigtriangledown$	Water level

#### Sampling and Testing

- A Auger sample
- B Bulk sample
- D Disturbed sample
- E Environmental sample
- U<sub>50</sub> Undisturbed tube sample (50mm)
- W Water sample
- pp Pocket penetrometer (kPa)
- PID Photo ionisation detector
- PL Point load strength Is(50) MPa
- S Standard Penetration Test
- V Shear vane (kPa)

#### **Description of Defects in Rock**

The abbreviated descriptions of the defects should be in the following order: Depth, Type, Orientation, Coating, Shape, Roughness and Other. Drilling and handling breaks are not usually included on the logs.

#### **Defect Type**

Bedding plane
Clay seam
Cleavage
Crushed zone
Decomposed seam
Fault
Joint
Lamination
Parting
Sheared Zone
Vein

#### Orientation

The inclination of defects is always measured from the perpendicular to the core axis.

- h horizontal
- v vertical
- sh sub-horizontal

ar

sv sub-vertical

#### Coating or Infilling Term

clean
coating
healed
infilled
stained
tight
veneer

#### **Coating Descriptor**

ca	calcite
cbs	carbonaceous
cly	clay
fe	iron oxide
mn	manganese
slt	silty

#### Shape

cu	curved
ir	irregular
pl	planar
st	stepped
un	undulating

#### Roughness

ро	polished
ro	rough
sl	slickensided
sm	smooth
vr	very rough

#### Other

fg	fragmented
bnd	band
qtz	quartz

#### **CERTIFICATE OF ANALYSIS 294891**

Client Details	
Client	Douglas Partners (Cairns) Pty Ltd
Attention	Aidan McDonald
Address	13 Industrial Ave, Stratford, QLD, 4870

Sample Details	
Your Reference	214803.00 Rocky Point, Proposed Residences
Number of Samples	3 Soil
Date samples received	06/05/2022
Date completed instructions received	06/05/2022

#### **Analysis Details**

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details			
Date results requested by	16/05/2022		
Date of Issue	16/05/2022		
NATA Accreditation Number 2901. This document shall not be reproduced except in full.			
Accredited for compliance with	SO/IEC 17025 - Testing. Tests not covered by NATA are denoted with *		

Results Approved By Diego Bigolin, Inorganics Supervisor Giovanni Agosti, Group Technical Manager Authorised By

Nancy Zhang, Laboratory Manager

Method ID	Methodology Summary
Ext-037	Analysed by Sydney Environmental & Soil Laboratory
Ext-062	Analysed by East West Enviroag
Inorg-001	pH - Measured using pH meter and electrode in accordance with APHA latest edition, 4500-H+. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-002	Conductivity and Salinity - measured using a conductivity cell at 25°C in accordance with APHA latest edition 2510 and Rayment & Lyons.
INORG-127	Total Nitrogen by high temperature catalytic combustion with chemiluminescence detection.
Metals-020	Determination of exchangeable cations and cation exchange capacity in soils using 1M Ammonium Chloride exchange and ICP-OES analytical finish.
Metals-020	Calcium and Magnesium analysed by ICP-AES and SAR calculated.

LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Contro	Quality Control Definitions							
Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.							
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.							
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.							
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.							
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which							

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

are similar to the analyte of interest, however are not expected to be found in real samples.

The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

#### Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

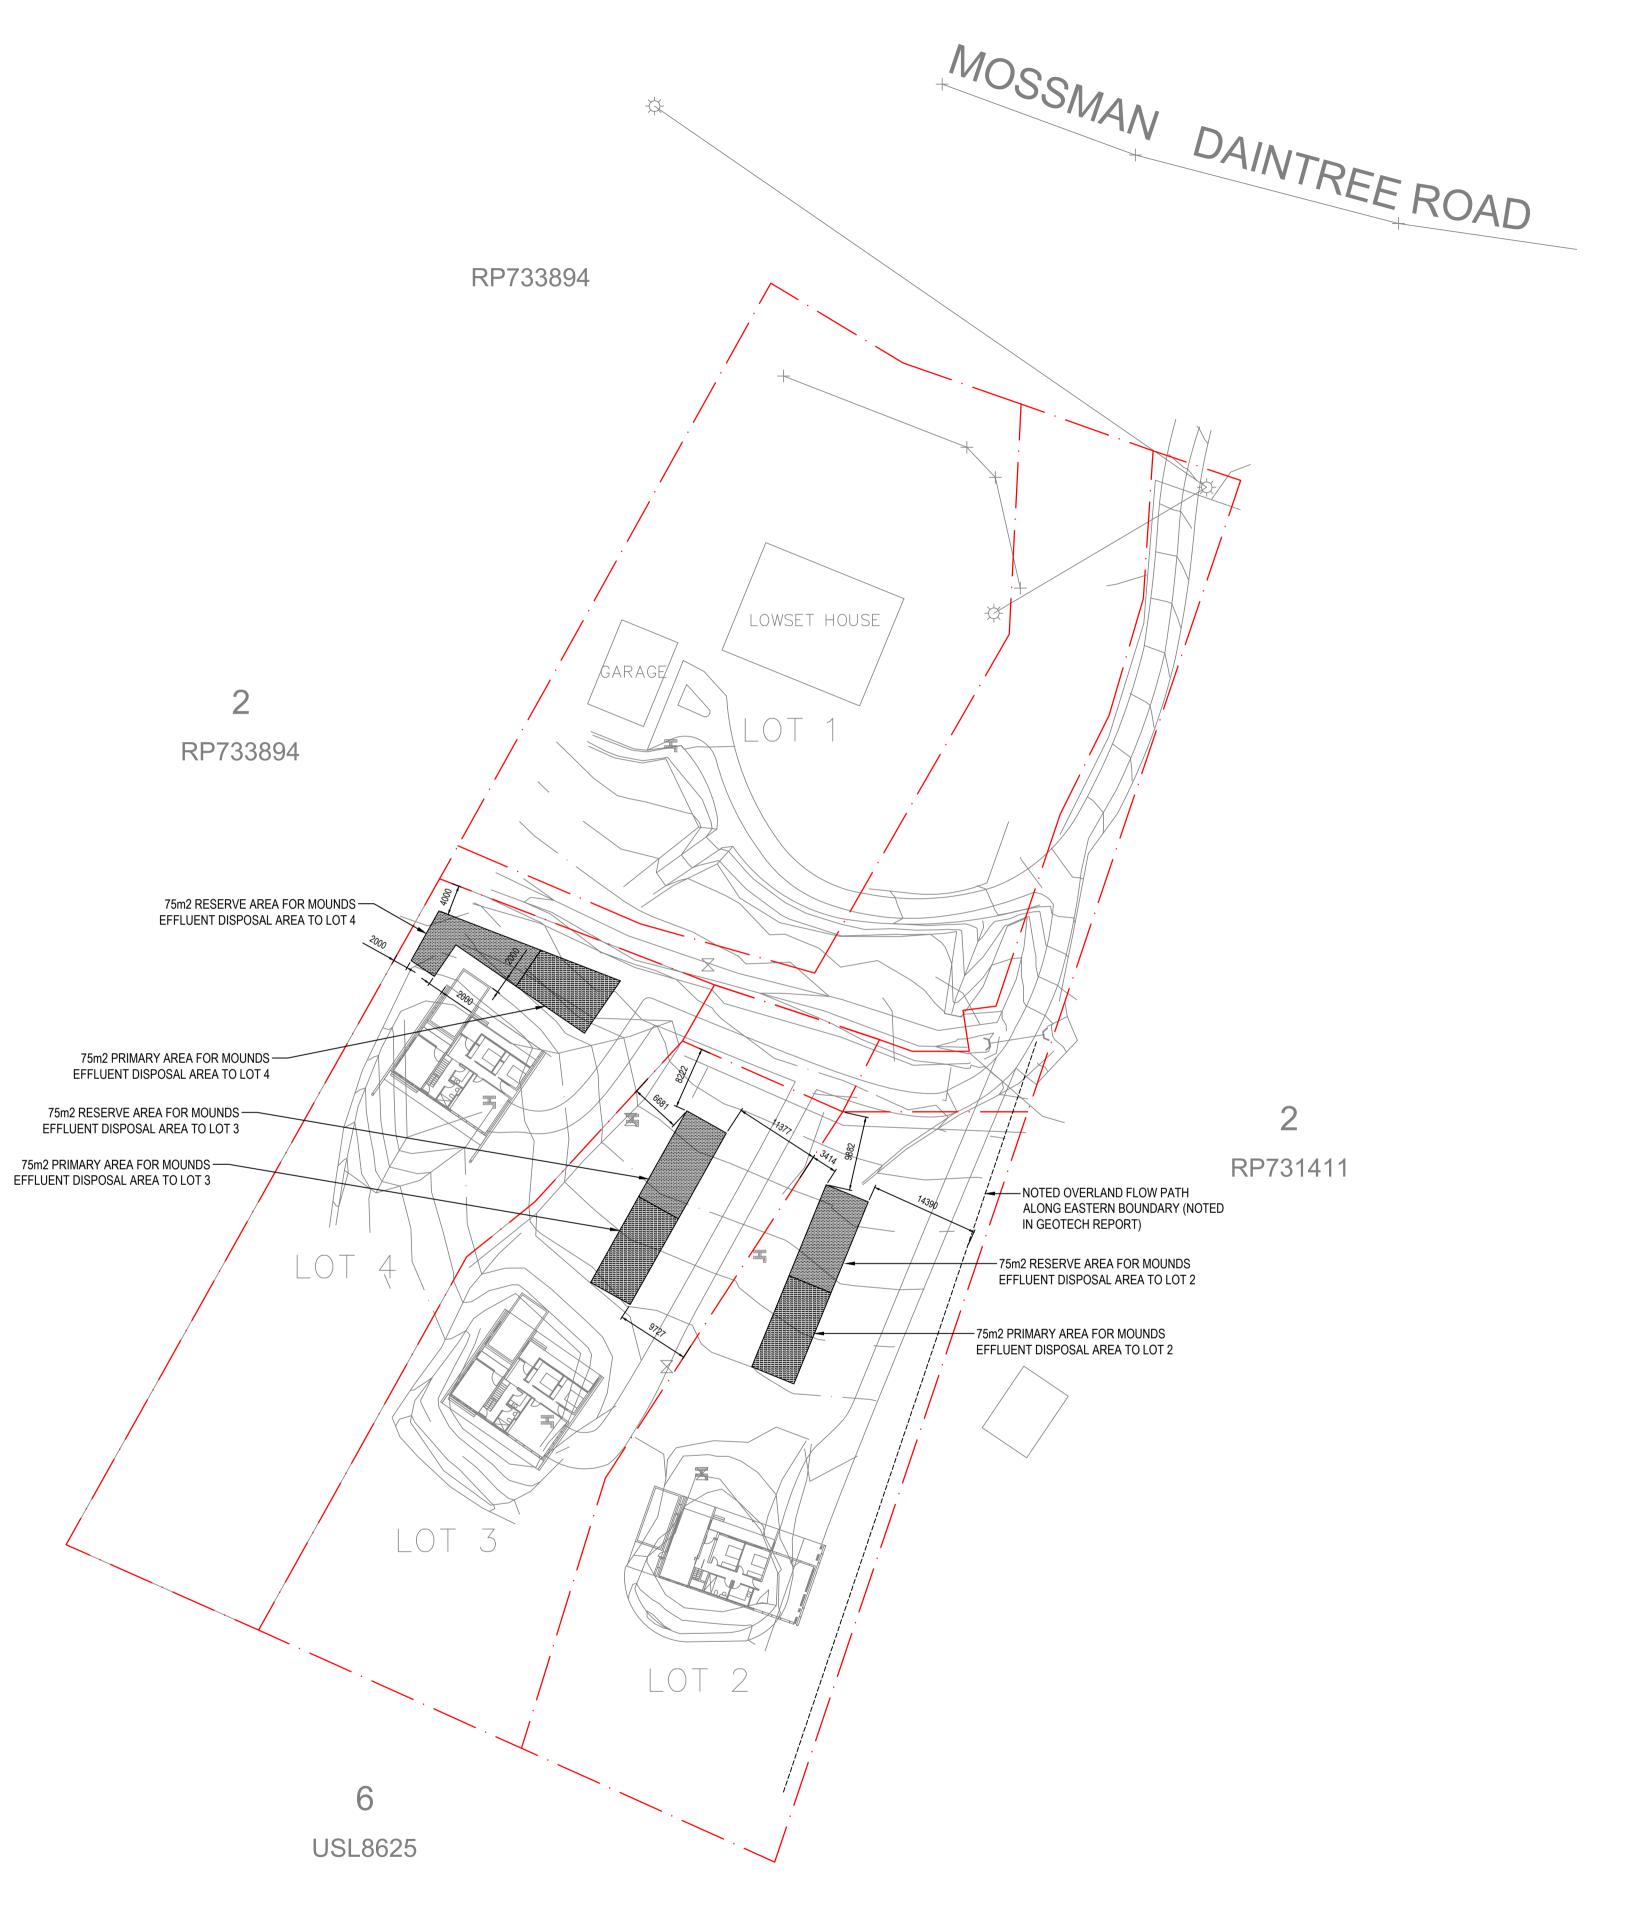

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

### 1 INTRODUCTION

ACOR Consultants have been engaged by Office Deicke to prepare water assessment for the domestic water supply at 1299 Mossman-Daintree Road, Rocky Point to determine domestic water storage and pump requirements for the project.

DA conditions from Douglas Shire Council state the client must provide council with flow and pressure testing from a fire hydrant on the authority main at the front of the property to determine the available domestic water flow and pressure to site.

### 2 PROPOSED DEVELOPMENT

The project comprises construction of three (3) individual residences located on three (3) separate but adjoining allotments Lot 2, Lot 3 and Lot 4 of the subdivided property at 1299 Mossman Daintree Road. Each residence to be two storey and constructed on the existing building platforms provisioned when the property was subdivided.

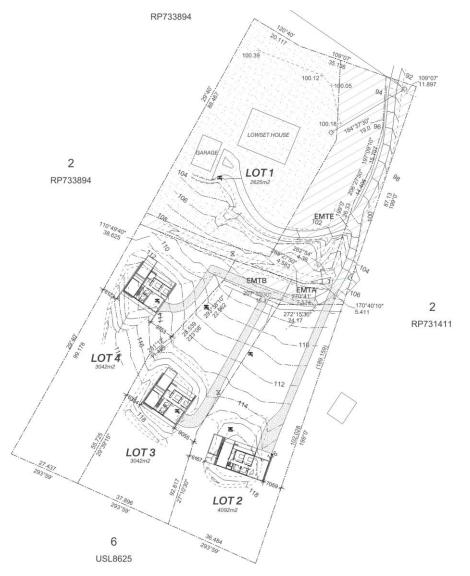

Figure 2.1 – Proposed Site Locality

## **3 SITE INVESTIGATION**

A flow and pressure investigation was undertaken on the 30 May 2022 by Budget Fire Protection.

There is a Ø150mm water main on the opposite side of Mossman-Daintree Road. Council advised this service is to be made redundant in the future. There is a Ø225mm water main on the same side of Mossman-Daintree Road with a fire hydrant located towards the end of this main. This street hydrant was used for testing purposes.

The site has three water meters located at the north-east corner of the site which are fed via a Ø50mm branch pipe connected to the Ø225mm authority main.

To ascertain the available flow and pressure in the Ø225mm authority main, water was drawn at 5L/s increments from the fire hydrant while recording the pressure at each increment up to a maximum flow of 16L/s @ 0kPa. This was done while simultaneously recording the residual pressure at each increment at the water supply entering the property. Refer Appendix A – Flow and Pressure Testing.

# 4 **PROPOSED SOLUTION**

We note the following design parameters:

- Flow and pressure testing indicated there is 480kPa of pressure available in the authority main at static (no water being drawn).
- The authority main is located at approx. RL 91m and the most disadvantaged
- The most disadvantaged fixture in the Lot 2 residence will be at approx. RL 120m
- The most disadvantaged fixture in the Lot 3 residence will be at approx. RL 120m
- The most disadvantaged fixture in the Lot 4 residence will be at approx. RL 116m
- The minimum design pressure to be provided at fixtures is 250kPa
- The maximum design pressure to be provided at fixtures is 500kPa

It is not proposed to provide any domestic water storage at each residence noting the authority main is capable of suppling 5L/s @ 400kPa, with each residence only requiring 0.38L/s.

It is proposed to provide a domestic water pressure booster pump at each residence to ensure minimum domestic water pressures for the residences. Refer Appendix B site plan for proposed locations.

Each pump to be a Grundfos JP PT-V booster (or approved equivalent) that consists of a vertical pressure tank and a self-priming, single-stage centrifugal pump. Refer to Appendix C for pump specification and Appendix B for calculations.

Attention David Colmer

#### **Report on 1299 Mossman Daintree Road flow readings**

At the front of the property, you have a 150-mil pipe on the opposite side of the highway to the property.

On the same side as 1299 you have a 225-mil pipe that is feeding the properties.1299 has 3 water meters entering the property via a 50-mil pipe.

The water authority officer for the shire said that the 150-mil pipe will become redundant due to age and condition.

He advised that we would be wasting our time taking readings from this main.

There is a hydrant nearly at the end of the 225-mil pipe line so I connected my flow meter up to it and discharged water at 5 litres per second up to a maximum flow of 16 litres per second where the pressure was 0 at my flow meter.

The council fellows took pressure readings going into the property as follows

Flow meter at hydrant (close to the end of the line) Static 480kPa 5 Litres a second 440Kpa 10 Litres a second 300Kpa 15 Litres a second 120Kpa 16 litres a second 0Kpa Pressure readings going into 1299 400Kpa 400Kpa 390Kpa 380Kpa 380Kpa

If you require additional information in regards to the above please ring me on 0408 279 322.

Kind Regards,

3. VJate
